The best way to learn about the local network is to ask a local. You've started well by grasping the idea that node hopping is generally rather unproductive. Beyond a couple of hops, 1200 baud performance becomes so bad in terms of throughput that anything other than Digi-Dxing is a waste of time (and that, done to excess, is often considered anti-social). The best use of 1200 baud is for local direct 2-way contacts or for accessing the BBS for mail forwarding services. Higher speed, higher performance, LAN systems open up many much more interesting operating possibilities.

>Also, I'm working at 1200 baud. Is it not possible to work at higher baud
>rates on 2 meters or must I work in the GHz range for 19200?

9600 baud is possible and relatively practical on 2 meters with the right radio. To run 19.2 kb and faster, however, the Rules force us to use 222 MHz or higher. Most of the higher speed activity, 19.2 kb and 56 kb, is done on 222 MHz and 440 MHz. Even higher speeds, up to a couple Mb, occur at 902 MHz and above. Naturally, you need someone else with similar equipment on the other end to make a go of the higher speeds. It's important to consult with the locals before making equipment purchases, or you may find no one with which to connect.

Gary

Have you sanded the paint off the mating surfaces of the tin box?
The MFJ can be pretty quiet *if* you get a good metal to metal
connection all the way around. Use good RF practice and add a
screw every 5 cm along all seams. Once you have the box *tight*,
it'll do a good shielding job. Of course you need toroid chokes
on the DC leads, and shielded cables on everything else.

>>Is there a FAQ or recommended book, or any literature on packet radio?<<

CQ Communications offers two packet products:

-- "Getting Started in Packet Radio," an introductory video with a focus on operating; and
-- "The Packet Radio Operator's Manual," a more technical reference book on how packet works, including wiring diagrams for popular rigs and TNCs.

We can also get you copies of these ARRL packet books:
-- "Your Packet Companion," an introductory guide; and
-- "Your Gateway to Packet Radio," a more advanced reference.

If you'd like more information, please send an e-mail message to any of the following addresses: CQ@genie.geis.com, CQMagazine@aol.com, 72127.745@compuserve.com, 71301.424@compuserve.com or p00259@psilink.com.

The April CQ magazine contains a review of the MFJ 2 m packet radio. I gather from reading between the lines that it is less than perfect, however, the price makes it worth a second look.

Has anyone got any experience with this rig? How does it do in "intermod country". How does it compare to the Alinco DR-1200HT?

From: erik@ve7mdl.ampr.ORG
Message-ID: <12898@ve7mdl.ampr.org>
Source record: 43800

I saw some comments flashing by my screen a few days ago about the AEA PK-12. Has the firmware been updated? If so, where are the areas of improvements?

I have tried to use a PK-12 on one of my BBS ports, but one of my users has a Baypac and the PK-12 does not decode his signal very well. My PK-232 MBX does just fine. I figured it was the filtering in the PK-232 that cleans up the signal (he uses a slow PC), but I am not sure.

I'd really like to free up my PK-232 for HF work. Suggestions anyone?

73 de VE7MDL ....Erik.

1661. LBBS (Linux BBS)

Hi,

LBBS 0.1.5B uploaded to:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/LBBS-0.1.5B.tar.gz

--- History ---
0.1.5B 16 Apr 1995
Opps, Rline list not setup before going to Filters, and so return
address always ends up being local.
Added 'AcceptDieBoxRlines' to Config.
I've hopefully now fixed MBL reverse forwarding, bbstx will offer
all it has, then it will F> and wait for response. Respond to any
items offered back then disconnect. Can I offer some more once the
remote system sends its '*** Done' if I have some?
Added script/doexpire, bin/aux/expire. To start tidying up the
history file.
Removed (un-intended) case-sensitivity to 1st field of 'Feeds' and
'Hroute', also To, From and At fields of 'Filters' plus Id field in
'Reject'.
Moved the util 'wp' into ./bin/tools/.
Added Install.sh, untested as of this time, also README.Upgrade.
Fixed the cause of some corrupted entries in the history file, this
will not have shown itself in previous versions of LBBS as a
problem but with the new expire utility added it was found.

* NOTE: THE 'histroy' DATABASE FILE MIGHT HAVE CORRUPTED ENTRIES FROM
EARLIAR VERSIONS, PLEASE DESTROY YOUR OLD .dir AND .pag FILES.
YOU WILL SUFFER LITTLE CONSEQUENCE AT THIS EARLY STAGE IN
DEVELOPMENT.

Just thought I would mention this.....I was thinking of buying a PK-12 and the guys at Ham Radio Outlet (in Phoenix) said they would steer clear of it for now! Seems a lot of people are having the same problems you are. Just to check out what they were saying I called AEA. A guy there by the name of Dave Duzenak (??spelling) told me that as of the late January update most of the problems had been resolved. Ham Radio Outlet disagreed!! You may want to try this Dave Duzenak at AEA. He told me to call if I had any problems with the PK-12. By the way ... I ended up buying the Kantronics KPC-3. Glad I did.

Problem solved: Turns out that the modem cable used was not a "high
speed" cable (14,000). We didn't realize that there were different speed
rated cables.

Thanks for the responses. Why it worked on my PPC and not the Performa is
still a mystery but we figured that is had to do with how fast the PPC
transfers the data in comparison.

1667. New Web & ftp addresses for Kentrol -- new version too!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-18 00:00:00 UTC
From: Brian Gilhuly VE3BGB <brian@kentrol.synapse.net>
Message-ID: <3mv09r$q4n@sentinel.synapse.net>
Source record: 43934
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.shortwave

Kentrol's net addresses -- for the Web page and the ftp archive --
have changed. Now to reach the leading edge in rig control software
with these URLs:

World Wide Web http://www.synapse.net/~kentrol/

From there you can read the documentation and preview the interfaces
of Kentrol and SkedMan, as well as download the latest shareware
versions from the archive at ftp://ftp.synapse.net/private/k/kentrol.
Even if you don't have Web access, you can obtain both programs
by anonymous ftp from:

ftp.synapse.net/private/k/kentrol

New enhanced version 5.1 is now available via either route!!

Kentrol is a Windows 3x control program for Kenwood HF transceivers
and the R-5000 receiver, which has built-in logging and memory
management capabilities. Since its introduction in 1991, Kentrol has
set the standard for Windows-based rig automation and new features
continue to be added regularly. SkedMan is an automated sked manager
for Kentrol. Enter schedule data, set alarms and when an alarm goes
off, SkedMan uses - even launches - Kentrol to tune it in.

Kentrol and SkedMan are shareware, so if you haven't tried them you
are most welcome to do so.

Kentrol is also available from major radio-related ftp archives
worldwide and on CompuServe, and there are linkds to the Kentrol Web
page from all the best ham & swl pages.

Try it; you'll like it!

efforts.

Gerald, it sounds like the TNC is doing fine (at least receiving), "T:"
will only increment on valid KISS packets from the TNC. The "F:" and
"D:" boxes should be incrementing also. If "D:" is incrementing on you
can't call up the directory with ViewDir, you may want to check your
subdirectory assignments for each satellite.

BTW, you can turn off the KISS file option (it just clutters up the HD).

>I would guess I have something set wrong but I can't figure it

>so no joy. Any help will be greatly appreciated.
>By way of my contribution I played with the mike drive on the 736
>with the deviation meter in line and found no change in deviation.

Maximize the mspe window, so that you can view everything coming from
bird and try sending some manual fill requests (directory or file,
doesn't
matter) to see if the bird responds. If no OK's or NO-1's, then you're
not
making it. You may want to look at your 736 mod to the varactor or your
cable from the TNC to the radio.

Just some ideas, hope they help.

I can see where you could easily use phone modems to access a TNC in a
remote location. As far as over the air could be a problem, the first
one I can think of would be fairly easy to remedy, the second maybe not.

1. Your high speed modems use PSK (I believe it's QPSK, but I'm not sure.),
this can be overcome by connecting to the radio just like a 9600 BPS TNC.

2. Phone modems use one pair of leads for TX and RX audio. I'm not sure
which brands still allow you to set the modem for leased-line operation.
This would arrange two pairs in the RJ-11 connector, one for each.

It should be fairly easy to tap into the RS-232/EIA-232 for the CTS line,
and make use of that for your keyline. I'm not sure how effective this
would be, due to the modem being made for full duplex. Even 'half duplex'
isn't truly simplex, so you will probably run into problems there too.

INET: n6315@pnet16.navy.mil
The voltage mentioned by Dave might possibly hurt your relays. Most
of the teletypes in Naval use have been running on Low-Level (+/- 6V).
You could try that first, it won't hurt.

Try loading the software with the extensions turned off (hold down the shift key on star-up). You may have an INIT conflict going on with some other program.

In article qmi@news.onramp.net, Bob Winingham <kc5ejk@onramp.net> () writes:
>
>Some older MAC's needed a control panel called Serial Switch but I don't
>think is your problem but check to see that "Serial Tool" is in your

>
>I am using same TNC and software on a MAC II and a Mac IIFX under system
>7.01 to 7.5.1
>
>BOB KC5EJK Dallas
>

Based on the above response, the chances are that the model and the MacOS aren't to blame but rather another program like SAM Intercept or a myriad of other useful INIT programs that conflict or interfere with the installation. One other thing you might try is to make sure you drag and drop the installation script onto the Installer application that came with the program (disregard this suggestion if you are installing from a .sit or a .sea file). There are a lot of different versions of Installer out there, one of which may be on your Mac and is not the proper one for the software you alre loading.

From: Gary Crum <crum@xmission.com>
Message-ID: <3n28ii$9rq@news.xmission.com>
Source record: 43810

Thanks for the followup, Steve, and I just learned about the msys-request@hamnet.wariat.org mailing list from your signature. I'll have to mail this message to that list and also find out if there is an archive of the list available.

Okay, so mail gateway functionality might be possible by using JNOS off an MSYS port. Interesting. Now, are there any gateways operating this way that you know of?

For example, does there exist a mail gateway, call it <gateway>, such that I can send mail to you using Internet SMTP to an e-mail address containing your "Amateur Radio" (MSYS BBS) mail address, perhaps something like: no8m%no8m.#neoh.oh.usa.na@<gateway>

Thanks for any info! It would seem to me that that would be a natural for such mail gateways to exist, but then, perhaps this is like the issue of telephone autopatch "gateways" on amateur radio voice repeaters.

1678. Re: WISP Help Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-19 00:00:00 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3n3bpc$5k8@newshost.lanl.gov>
Source record: 43811
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Ken and all who offered help,

It is running now. The problem was with the KPC-9612. WISP
needs to be able to access the extended KISS instruction set
and use port2 apparently the 9612 defaults to port1.
What I learned is there are a couple of things that have to be
done form another terminal program before MSPE runs.

The TNC interface has to be in terminal for you to be able
to access these commands. If they won't work type "int term"
from the cmd: prompt. The TNC setup commands are:
maxusers 0/1 ;this locks TNC to port2
mydrop 1/0 ;this allows the extended KISS command set on port2

When this is done get out of your terminal program and start WISP as usual.

:note the maxusers may not be necessary I will experiment and
report. With the new WISP you can do this from within the program
I expect to get this done this weekend and will post instructions
Monday.

73 de Jerry finally on the birds.

: I have browsed around a few web pages, asked around, and read some printed
: literature, without finding a working mail gateway so far.

: Gary

Oh dear oh dear oh dear. First things first. As far as Msys and TCP/IP are
concerned, MSYS is brain dead. Totaly usless for what you hope to use it for,
it's a good BBS package. Hopeless as a TCP/IP package.

To run a internet gateway try something like JNOS, that has the support that
you will need.

I used Msys for over a year and I liked it except for the TCP/IP side, but then Mike from
memory did'nt plan on fixing the IP side .

To run a complete package try you will need something like AAA4RE and JNOS
or the FBB + BPQ + NOS + a multitasker like deskvu.

Cheers John VK7AD:wq

> Does anyone have any suggestions for radios (that are likely to be found at
> a hamfest) that fit this bill?

Ross, for 9600 baud, you want a radio that does direct FM, IE not a
phase modulator, and one that does *not* have a synthesizer in the
modulation loop, IE mostly older crystal controlled radios, or one of
a very few hetrodyne synthesizer rigs (IC-820H, Azden PCS-9600D, etc,
but *not* the Kenwood TS-811A or TS-711A). See Jon Bloom's article
in the May QST to learn why.

Older Motorola rigs, (Mitreks, Micors, etc) work for high band (2m) or
UHF (70cm), and things like the Icom 22A (note 'A' not 'S') will also
work (2m). But your best bet is to just buy a new Tekk KS-900 (70cm).
They work, they're cheap, end of story. You don't need, or want, a
frequency agile radio for packet. You need to stay on your WAN frequency
so others can find you to send you Email. Make use of the network
switches to get your traffic out of your WAN. If you must have more
power than the Tekk provides (2 W) then go for a Kantronic D-410 (10 W)
or one of the Motorola boat anchors(up to 100 W). You generally won't
need such alligators, however, since if your path is badly impaired,
multipath will kill your BER anyway. I suggest mounting the Tekk right
at the antenna, and feeding the data streams via fiber optic links
(Black Box Corp.). That will minimize RF losses, and offer your
TNC and computer lightning protection. The Tekks are cheap enough
that they can be considered expendable. (If you live at a nasty
high RF site, cavities, or helical filters such as the Toko units
available from DigiKey, in front of the Tekk will be required.)

1683. Tekk KS900L some questions.....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-19 00:00:00 UTC
From: mike@unixphf.ampr.ORG
Message-ID: <199504191320.NAA23413@unixphf.ampr.org>
Source record: 43816

Hi, I have recently ordered a Tekk KS-900L radio and have one or two
questions.

1) Can somebody give me the pin out for the 9 pin D-type data socket?
Also is it male or female?

2) Does the radio come with a power lead? If not what type of connector do
I need?

3) I have a g3ruh and Tiny-2, do I need any additional components, to add
between the Tekk and the g3ruh modem?

4) I have ordered the Tekk to come crystalled up ready to go. If I need to
change the frequency at some time in the future are service/tune-up
instructions provided with the radio?

5) What is the minimum txdelay I can excpect?

Any other comments about this radio will be very welcome!
(I would like to get leads etc ready for when the radio arrives!)

Please reply to myself (mike@lurpac.lancs.ac.uk).
Thanks and 73,
Mike.

TNC and computer lightning protection. The Tekks are cheap enough
that they can be considered expendable. (If you live at a nasty
high RF site, cavities, or helical filters such as the Toko units
available from DigiKey, in front of the Tekk will be required.)

Those helical filters look like they'll solve all kinds of nasty problems.
What impedence are they, and what's a good way of connecting them between
the antenna and receiver? Is there a cute hack (like back-to-back diodes)
that will avoid T/R switching? [If you want to fax something, i can make
it into a .GIF or .TIFF file and make it WWW accessible.] Is this a decent
alternative to a 4x3x5 filter for Satellite work [ARRL Handbook (1993),
p. 23-32]? I noticed that Radio Shack is using one in their new 2M PA,
and while the 1993 ARRL handbook tells how to roll your own, it doesn't
say how to use the off-the-shelf variety [anywhere that i could find].

Message-ID: <TVR.95Apr19114016@cnmat.CNMAT.Berkeley.EDU>
Source record: 43818

Is there a reference in part 97 that specifically states that prohibits radio amateurs from using a protocol that is not AX.25?? For example, can I use straight TCP/IP or better yet, can I devise my own protocol and put it on the air as long as I make the protocol public (no fun packeting to your self regardless of the protocol??) Maybe this is a FAQ? I am looking for specific referencs if anyone has one!!

When running TCP/IP, AX.25 is merely an encapsulation, just as you have something like 14 bytes in the front of an Ethernet packet, ahead of the TCP/IP header. You can certainly use AX.25 UI packets to implement other protocols, and perhaps if you ask nicely and have a reasonable proposal, you might even get your own protocol ID assigned to you.

The AX.25 is how everyone talks to each other, and while you might be able to come up with another protocol, who would you talk to? At least using that as an encapsulation will help assure compliance with Part 97, and get people interested in what you're doing, even if they don't have software that will talk to you. That's how the APRS folks do it, by the way.

IMHO, anyone who sends to WW (or WWW) when just wanting one country should be kindly advised otherwise. I don't have the list you require, but the majority seem to use three-letter.two-letter for country.continent (with some rather loose definition of continent in places), such as usa.na or gbr.eu.

(I have noticed that bulletins, as opposed to private messages, do seem to remain readable on BBs they pass THROUGH, but that is still better than addressing then WW[W] in the first place.]

Hi ...

Not entirely true. There is a discussion on this very topic on
the mail list now. MSYS appears to have been interfaced nicely with JNOS
to allow at least a couple of people to make the Internet connection.

If you can't get to the mail server, try contacting K8EIW@WB8BII or
N4LXI@N4LXI.

I would hope that the Internet would be used as a user port or a
wormhole to another MSYS or packet BBS. Trying to make amateur mail
into Internet mail and then back to amateur mail seems to really get
things screwed up. Adding 30 more lines of junk to a message might
not be progress.

That isn't a new group, Jim. That is an old *defunct* group that should
have been removed over a year ago by your news administrator. This group
replaces that group.

At the power level of the Tekk, you can just leave the Toko helical
filter in line. It does cost you 4 db of insertion loss, however.
A real cavity filter would be better, but for $19.56, the Toko can
be a problem solver.

The connector on the radio is female, so you need to wire up a male
mating connector. The pinout is as follows:

1 Vcc (not to exceed 11.5 VDC, nominal 9.6 VDC)
2 Ground
3 PTT (low for XMT)
4 Data IN
5 Data OUT
6-9 NC

>2) Does the radio come with a power lead? If not what type of connector do
>I need?

As shown above, power is connected via the DB9.

>3) I have a g3ruh and Tiny-2, do I need any additional components, to add
>between the Tekk and the g3ruh modem?

Just a 10 volt regulator for power, and perhaps a resistive voltage
divider to get the DATA IN signal down to 50mV.

>4) I have ordered the Tekk to come crystalled up ready to go. If I need to
>change the frequency at some time in the future are service/tune-up
>instructions provided with the radio?

Yes, however, the radio can easily be tuned to produce spurious products.
A spectrum analyser is recomended.

>5) What is the minimum txdelay I can excpect?

The spec is <8mS, but typical values can be as low as 4 mS.

1697. SSTV, JVFAX 7.0 and PK-900 TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-20 00:00:00 UTC
From: bob@ia-ngnet.army.mil
Message-ID: <3n61t1$l2n@data.interserv.net>
Source record: 43830

I have a question about SSTV, JVFAX and TNC's. I want to try SSTV out and came across JVFAX 7.0. I read about the
different interfaces that it can use, including the simple easy to build type. The question I have is, I have a AEA PK-900
multimode TNC and wonder if it would work? I know that it has the FAX mode built in the TNC but how should I set it up.
Thanks for any help

I changed from the Amiga to a PC last year, and for quite some time couldn't find any software for the PC that functioned as well as the software I had for the Amiga.

Then I installed Lan-link, and found it really good. Definitely worth getting hold of a copy.

>listening to a GTOR QSO in progress.

>As such, I gotta say: GTOR, however technically wonderful it might
>be, is, in its present incarnation in the KAM Plus, a total waste
>except for ragchews.

Until you get out on the road and actually use it, you might be
tempted to see it this way. However, in actual use, like as if
you got in a vehicle, drove 300 miles and then connected to home,
it works GREAT. It blows the pants off of AMTOR and makes Pactor
an also-ran.

It's amusing seeing the arguements of people who can write books about
theory but just don't bother to actually physically test what they
are saying with a radio and a TNC.

1713. Share disks under windows ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-21 00:00:00 UTC
From: parnoul@amoco.saclay.cea.fr
Message-ID: <3n8e85$g6p@anemone.saclay.cea.fr>
Source record: 43846

Hi there,

There might be a bunch of people out there DOS/WINDOWS aware, may I
asks for your help ?

I would like to share disks between to distant PC's under DOS or
better windows via a dialup modem connection.

The DOS 6 interlnk doesn't work out as it does not handle dialup
modems but just a null modem cable between to PC's as far as I understand.
More, intersvr cancels the windows task switching and I have an application
running on both ends.

Well, full duplex would be great...

I guess it wouldn't be a problem under linux, NFS and so on, but my application
is DOS or Windoze...

My application ? I have a video blaster board digitizing images from a camcorder,
a jpeg compression library saving the image in a file.

On the other side, I have a jpeg viewer decompressing and displaying the fresh
image onto the sreen.

With a transparent file sharing over a dialup connection, I have my video phone
application setup without writing a line of code... I haven't got very much time
for experiments by now, and I also like to build on standards.

A packet radio version of it would also be great, for now my brother also equipped
with a video grabber (though not the same make) is not licensed...

Thanks for any suggestion, a CC: to my Email address would be great.

Karl,

If I remember correctly the data are transmitted by a rather
weird method (a series of interrupts?). You can find probabely more
info in the (english) manual of the driver program TFPCX, ver 2.10.

Source record: 43854

I'm a complete beginner on packet radio (as a matter of fact, any kind of radio), I've been doing some reserach about using packet radio to transmit TCP/IP, a nd it seems to be a very nice solution.

What I want to do is link my BBS system to the internet using packet radio, the problem is, I don't know any equipment brands, law requirements, etc.

Can anyone give some explanation about the needed equipment? I mean, what kind of radio I need, what kind of modem, who can give me an IP address, etc.

I am located in Mexico City, and plan to use 9600 or greater speeds on the modem.

Many thanks in advance for your help!
Alejandro Kurczyn

Macintosh Amateur Radio Software - Feb. 1995
Version 1.0.9

Sorry I have been so delinquet in getting this list back to the nets... but I have been busy trying to recover from a hard disk crash! Please note that I have changed my e-mail address for BIG files. If you are so inclined to send them... please send them back to the address this post originates from.

Please feel free to distribute this list as widely as possible. Many of you have asked if it is OK to cross-post this list? I don't mind, but I would like to know where it is going. If you think it should be cross-posted to other USENET groups, please let me know so I can try and manage these. We don't want to have any duplication or our welcome will be wore out!

Those of you that can tell me about ANY of these programs compatibility with System 7 would be appreciated! I am going to be adding a System 7 compatability section to EACH description in future releases. If the application is KNOWN to execute properly under System 7, the System 7 anotation will be placed as the last line of the product description. More clarification on levels of System 7 compatibility in the future editions... but this is a start!

Some of the information in this list was gleaned from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: I am continuing to add more version numbers so that our users will know if they have the most current release. Thanks to those that have already sent them in... I'll accept all corrections! I just saw on the net two other lists that I'll try and compare with this list very quickly and see if there are holes!

A new release of both NET/Mac and IM/Mac are now available.

The Mac version of Automatic Position Reporting System (APRS) is is NOW available at ucsd.edu. It really looks great... thanks Mark and Keith Sproul!

Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software. The ARRL ListServer is also carrying the latest version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4.
Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com
NOTE: Diana no longer is supporting this software, she no longer has a Macintosh computer. Diana, thanks for your wonderful contribution to the Amateur Radio community for these stacks!
System 7 savvy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each

license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters. Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Freeware. Available via anonymous FTP from simoon.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@simoon.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice files. David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your receiving speed. It has several ways that it can send letters and punctuation. Shareware. Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savvy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training programs is that this one will not continue sending until you provide the correct answer. Major changes which have been suggested and implemented since last version include: after three incorrect responses the program shows the correct character; the list of characters at the end which will show those you know and those you need more practice on; the frequency of the tone has been changed; volume of the tone has been reduced; the character " - " has been added (dah dit dit dit dah) Comments can be sent as follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD 21719

*** Packet and other digital modes ***
<NET/Mac 2.3.47>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use. The latest releases have added support of multi-port serial boards like AE's QuadraLink. It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the

modifications to NET/Mac. This version (and others) is available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming), mac.archive.umich.edu and oak.oakland.edu (/pub/hamradio/mac/digital/)
System 7

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file that PC owners use with NOS. Created by Ken-NS1C is available on many TCP/IP packet switches in New England.program.
System 7

<IM/Mac 1.0b28e>
Mailer program for use with the SMTP protocol. Alternative to the BM program that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly updating his mailer program. His newest release supports StuffIt Expander 3.5.1,built-in BinHex support, selectable sound chimes for incoming mail, "quoting" of forwarded messages and lots more. If you are not using this program... why not? Check for the latest release in the directory before "blind" ftp'ing. This software supports System 7's Ballon Help and is System 7 savvy! Available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming).
Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo!!!
System 7 savvy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use with packet-radio modems such as the Baycom kit and PacketMac Modem. Version 1.8 July 9 1993 update since 1.6. KD6PAG found a bug in quoting recieved escape and end characters is sofktiss 1.6. The bug and the fix and patch are all correct, thanks for some great detective work. Lots of doc files and drawings included in this archive! Requires the Serial Tool from Apple's Communications Toolbox! Available on the HAMNET forum of Compuserve, America Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).
System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O. Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.2>
A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC, unlike MacRatt or HostMaster. A demo version of the product is available at cpre1.ee.iastate.edu (pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX. Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, multiple connects; supports KPC-2, KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.07>
PacketTracker ver 1.07 is a SHAREWARE program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox which is NOW included in the archive.
System 7

<MacAPRS 1.3.1>
There will soon be a Mac version of the APRS (Automatic Position Reporting System) software. Folks use this to collect packet beacons, plot channel activity, track chase vehicles for marathons, etc. When it's out, I'll let you know.

<DSK_Loader 1.0>
DSK_Loader is the Macintosh equivalent of the DOS program DSKL. With this program you can communicate with the DSK (DSP Starter Kit) from Texas

Instruments. This program bootloads a simple communications kernel and then loads other software using this kernel. Other options are: Fill DSK memory with a certain value; Dump DSK memory into a textwindow, for further processing; Execute programs on the DSK; Graph output from the DSK; Act as a dumb terminal to the DSK.
The DSK and thus DSK_Loader is most interesting for people who want to experiment with Digital Signal Processing at low costs. For HAM-Radio operators it is a very interesting piece of equipment, Some applications, like the KC7WW port of the W9GR filters are included.
This program is public domain so you can distribute it to others, put it on BBS's, FTP sides, etc. If you encounter some problem s, bugs, find language mistakes in the help-information (english is not my native tongue), or just want to know me that you use this program, feel free to write to the address below, by email, or just postal mail. Please add information about the system you use, and the application you use the DSK for. I also like to hear your wishes for future versions.
Author is available on the internet: G.Polder@CPRO.AGRO.NL. Gerrit Polder-PA3BYA, Prunus 8, 3904 LV Veenendaal, The Netherlands

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging ***
<Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 3.5>
Allows real-time or post-contest logging of a wide variety of contests. Checks for dupes, figures scores instantly, and offers various printouts. Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to Kenwood transceivers, and to MacinTalk for easy post-contest entry. Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!) N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

*** Callbook data tool ***
<Hamcall 2.0>
This is the application that is used to support Buckmaster's Hamcall CD-ROM. This application provides much more data than previous versions including lat and long coordinates. Allows search by callsign as well as Zip Code sorts.
More information at info@buck.com
System 7

<SAM>
Amateur Radio Callsign Database now supports Mac interface. No additional information at this time.

*** Propagation, gray line, DX headings *** <DX Map v1.1>
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0. Available via anonymous FTP from

joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also

calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.
System 7 compatible.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack>
<OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557)
(Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)
System 7 compatible

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<MacSPOC>
Author is on AOL and can be reached as adamod@aol.com via the internet. The "demo" versions can be found at ucsd.edu.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

<Gallery's BBS>
Gallery's BBS is now available to the general public.Specializing in Amateur Radio shareware for the Macintosh computer.The board is open 24hours a day,7 days a week at 202-298-6009.Supports up to 9600 bd connections.Give it a call today! e-mail queries to:paulot@cais.com or N3MGA@WA3TAI.MD.NOAM

*** Online Services carrying Ham Radio software ***
<America Online>
Supports Macintosh, PC's DOS & Windows versions, PS/1, Apple //s, Casio

Zoomer. Ham Radio Club (keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364 Ext. 6285. This site NOT ftp'able (yet). Internet e-mail.

<CompuServe>
Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats. Call 1-800-848-8199 for information. This site NOT ftp'able. Internet e-mail.

<Delphi>
(more info at a later date) Internet e-mail

<GEnie>
(more info at a later date) Internet e-mail

<Prodigy>
Has ham radio message areas, no downloadable software. Limited internet e-mail.

==========
Misc. Internet FTP sites for Amateur Radio Macintosh software

joker.optics.rochester.edu (/ham)
sumex-aim.stanford.edu (/info-mac/app)
mac.archive.umich.edu various locations
vixen.cso.uiuc.edu (/pub/ham-radio)
ucsd.edu (/hamradio) many different subdirectories
(/hamradio/packet/tcp/incoming) newest
files temp holding area
(/hamradio/packet/tcpip/pa2aga)

>
> Please let me know if there are any other files available and where I can
> get them from.

The driver ax25.com was written by Pawel sp9vrc here in Krakow. In
fact that on several computers was a problem this proper working
this software, pawel made some versions os ax25.com.
My adive: lets try all the versins of ax25.com, one schuld
work...:-)
If some more problems lets try send email to:
sp9vrc@ampr-gate.oa.uj.edu.pl

I know tahat only this driver works with nos and baycom like
modem.
Also let try look ftp into ampr-gate.oa.uj.edu.pl (44.165.152.34)
there should be anower versions of driver, if no send me a letter
I'll uploaed it into this site..
Good luck Janusz SP9MZI

1730. KPC9612 --> kiss

Hi everybody!
I have KPC9612 and using it rather only with jnos.
The problem is:
when I pyt it into kiss mode it forgot that fact afterswitching
off.
The metod putting into kiss:
in any kind of terminal program (usually term90) I'll put my
callsign, then send "int kiss", "reset" and quitting terminal
software. All its ok till I switch off KPC. It returns into nativ
"virgin" mode, or into some non known state.
Previously I was used TNC2C and no was any problems, TNC
"remebers" it state.

Could anybody can tell something about that?

1732. FAX frequencies for UK wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-22 00:00:00 UTC
From: Pete@cctc.demon.co.uk
Message-ID: <798560777snz@cctc.demon.co.uk>
Source record: 43865

Hi

I have just started to play wih JVFAX and HAMCOMM. I tried them
years ago but gave up due to RFI. However, this laptop generates
next to none due to lack of CRT.

Now what I need is a collection of good, reliable FAX stations
to test the equipment upon. Idealy these would give me a range of
images (I can get maps @~115kHz) including photos and should be
easy to pick up in the UK.

I know this is asking a lot but....

If there is some form of FTP or WEB site with loads of frequency info
I would also be pathetically grateful to hear about that too.

Cheers
Pete

: successful people have been with using 9600 baud user ports on BBS systems

The 9600bps 431.75MHz network in Salt Lake County, Utah, works great for
the few users of it here, who generally use TCP/IP. There aren't any radio
club web pages in Salt Lake yet, but hopefully there will be soon.
Something like the really cool http://www.ve7ubc.ampr.org/, perhaps.
I guess I would consider e-mail list, web pages and such "bulletin board"
type services, although the term BBS is not very common in Internet
terminology. I think it is fun to use MSYS BBS systems every once in a
while, but it seems like they are rather isolated from other computer network
systems (as evidenced by the recent discussion about mail gatewaying --
I didn't find out about any operational mail gateways).

>are saying with a radio and a TNC.

You'll pardon me, Steve, but my comments _were_ based on using it!
But you (or someone) edited out the whole rest of my remarks that
might have given some context.

I'm interested in DX. But I'll stand by my remarks that for DX,
GTOR is a total waste right now. Since you can't eavesdrop on the
GTOR QSO's in progress, there's no easy way to decide whether to
stick around and wait for it to end. You can't tell the calls at
either end, you can't tell what they're discussing, you can't tell
anything. That's also a disadvantage to the DX station that makes
the mistake of using GTOR: he's never going to be able to work
as many stations because there's never going to be that ready and
waiting pileup when he finishes his current QSO.

If the whole point is merely best throughput and reliability on
the noisy ham bands, great, you got it with GTOR. So what??

The moment Kantronics comes out with an update that lets you listen
in on a GTOR QSO in progress, my opinion changes. Right now,
GTOR is a waste except for ragchews.

Methinks you've been reading too many books and should spend more
time in front of your rig. :-)

Hi, I would like to know which TNC is the best for packet on VHF (2M).
I plan to use TCP/IP so I need KISS mode. I do not plan to use (or
having) HF.

By answering a few questions you would help me quite a lot.

- What mode do they support?
(KISS,FAX,SSTV,RTTY,morse ...)

- What is TNC-2 compared to TNC?

- What is PACTOR ?

- Do they have any known problems?

- Is there any software packed with them?

- Do they have problems with some software?

- Do they have problems with some radios?

- How much memory do they have for mail? Expandable to...? for how much ?

- Do I need to supply the power voltage or does it comes with an AC adapter?

- Anything usefull to know ?

Thanks for any replies

1737. AX25 Amiga driver is on AmiNET

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-23 00:00:00 UTC
From: dave@cs.weber.edu
Message-ID: <3nd42d$b9e@news.cc.utah.edu>
Source record: 43870

I have placed my SANA2 AX25 Driver for the amiga on aminet (sites such as wuarchive.wustl.edu /pub/aminet). This driver allows software such as AmiTCP to work with KISS TNCs for doing TCP/IP over amateur radio. Sorry, for those wondering, it still doesn't implement the SANA2 online/offline commands as i've been hunting down a rather nasty memory problem which is now hopefully (finally) fixed (and, the driver is a spare time project). Well, enough excuse making.

If you use the driver (or would like to but can't because of some limitation) please send me email with your comments. I have an easier time devoting time to it if I know someone besides me uses it (and of course, now that i've finally put it on aminet it should have a much easier time getting distributed to those who want it).

It should be in aminet/comm/net

Both TNCs you list above support only packet. They are intended for VHF/UHF
use.

>
> - What is TNC-2 compared to TNC?

TNC-2 is an old TAPR standard TNC. Both the PK-12 and KPC-3 are better than
the TNC-2.

>
> - What is PACTOR ?

A HF mode.

>
> - Do they have any known problems?

No

>
> - Is there any software packed with them?

Both have a terminal program packaged with them. The AEA one is much much
better than the Kantronics onne.

>
> - Do they have problems with some software?

No

>
> - Do they have problems with some radios?

At 1200 baud any radio can be made to work. You will have more data
transferred over a period of time with better radio (better means faster RX/TX
and TX/RX switching times).

>
> - How much memory do they have for mail? Expandable to...? for how much ?

Both have a small mailbox that can be expanded to 100K or so.

>
> - Do I need to supply the power voltage or does it comes with an AC adapter?

Both operate from 12 VDC. You can power them from the same 12 VDC supply you
use for your radio.

>
> - Anything usefull to know ?
>

If you test a late software KPC-3 against a late software PK-12 on a marginal
path the PK-12 will have better throughput.

1741. How to convert packet format to usenet format?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-23 00:00:00 UTC
From: rsmits@ham.island.net
Message-ID: <042395115553Rnf0.79b6@ham.island.net>
Source record: 43874

I'm running a uucp news and mail forwarding site, and have as well an old XT in the corner running TPK to capture local packet messages.

Can someone steer me to a program that can convert packet format messages to usenet style messages and vice versa?

I can easily forward messages to my uucp users, but none of the subject categories show up, of course.

I'd like a program I can run from a batch file to convert the existing message base to a usenet compatible form that I can then forward in the normal way by uucp.

Thanks, Bob, VE7HS

Hi Mike,

Before you do anything else get a copy of the April 95 QST (I think that is the right issue). It has a great article compairing the various 9600 baud radios. Sure tells you in a fast way which radios are better than others. As far as I know all of the 9600 baud TNCs work. You sure can't say that about all of the radios!

Bill

Don't forget the annoying FCC rules about content (no dirty words, no
pecunary(sp) interest (i.e. commercial or money making activities).

Basically, you'll need to play the role of "moderator" for messages
passing from usenet to packet. A program probably could be written
to screen articles for dirty words, but pecunary interest posts
probably would need screening out by hand. But the dirty word filter
could reduce thehuman moderator workload. (I'm assuming you just want
to crosspost one or two usenews newsgroups).

A crude software filter might look for phrases like "1-900", "cost",
"$", "sale", "MONEY", "FAST", and the usual dirty words. But you'd
still need to review the stuff that passes that filter.

>TNC-2 is an old TAPR standard TNC. Both the PK-12 and KPC-3 are better than
>the TNC-2.

That's a very debatable claim. The TNC-2 is the defacto standard hardware for packet. There is third party firmware available as well as third party higher speed modem support. The KPC-3 uses a proprietary architecture, and there is no third party firmware available, and interfacing a higher speed modem is not plug and play. While the KPC-3 is a nice user appliance, you're pretty much stuck with what Kantronics provides.

With a TNC-2 compatible TNC, such as the MFJ1270, the PacComm Tiny 2, etc, you can run K3MC's KISS-only code which is very useful for unattended TCP/IP operations. (Kantronics and AEA support KISS in a limited fashion, but they are prone to drop out of the mode if a power bump occurs, and won't handle the longer packet lengths generally used at higher speeds.) A TNC-2 style TNC also allows you to use TheNet code, or X1J code to establish a node or switch. You can take advantage of the TNC-2 modem disconnect header to install a K9NG or G3RUH style 9600 baud modem, or with some modification, a GRAPES 56kb modem. None of these options are available to you with the KPC-3 or most AEA products.

With Kantronics products, and some AEA products, you're locked into the firmware and hardware support provided by the manufacturer. While that support is fairly good for the casual keyboard chat operator who is content to run plain vanilla AX25 at 1200 baud, there is no migration path to more advanced functionality. OTOH, the KPC-3 is small, and draws very little current, making it a good choice for portable operations. I'd recomend the Micropower Tiny-2 from PacComm, however, because it is small, uses low power, and is still fully TNC-2 compatible in regards to third party firmware and hardware.

Think of the TNC-2 and its clones as the PC of the TNC world, while the KPC-3 is more like the original Mac, a closed box with limited expandability.

1752. ?How to update my TNC-2?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-24 00:00:00 UTC
From: herksen@ibm.net
Message-ID: <3ng8ec$11je@news-s01.ny.us.ibm.net>
Source record: 43699

Hi there,
I have 2 TNC-2 modems (one from AEA, other one from ICS??)
It seems that there is a way to upgrade them to 9600 baud, as there
is an empty rom of pins on the board, that can accomodate a hispeed
board for 9600 baud.
Does anyone know where to get it, or, how I can make one??
Help would be greatly appreaciated!!
I'm available for comments on the following addresses:
herksen@ibm.net
TA2IX @ TA2EM.#IST.TUR.EU
2:430/205.11 (FIDO)

Thanks in advance.

1753. FBB MUX P.C. Board Information

```
TAPR Activities at Dayton '95
-----------------------------

Dayton is almost upon us and here is the list of TAPR activities and events
happening during Dayton. We hope to see lots of folks around and please
stop by the TAPR booth and say hi!

TAPR Booth
----------
The booth is located at the same location as the last several years. We
should have most items and kits available and another big membership offer
will be available to new members! Come by and say hi to the TAPR gang and
if you want, help out behind the table. The more the merrier.

Regional Groups Note: If you are with a regional digital group, please stop
by and chat with Greg Jones, WD5IVD about how TAPR can do things with your
regional group. There will also be a place at the booth to place regional
materials, so if you have something to hand out, drop it off.

Friday - TAPR Digital Forum
---------------------------
1:00pm - 1:45pm Introduction to Digital Communications
Greg Jones, WD5IVD
1:45pm - 2:00pm TAPR Update
John Ackerman, AG9V
2:00pm - 2:30pm Layer 1 and Radio Issues
Mel Whitten, K0PFX
2:30pm - 3:00pm TAPR/AMSAT DSP-93 Project Update
Bill Reed, WD0ETZ
3:00pm - 3:30pm TCP/IP Issues and Trends
Barry McLaren, VE3JF
3:30pm - 3:45pm BBS Issues and Trends
Barry Buelow, WA0RJT
3:45pm - 4:00pm HF Digital Communications Trends

4:00pm - 4:30pm APRS
Bob Bruninga, WB4APR
4:30pm - 5:30pm TAPR APRS SIG
Keith Sproul, WU2Z

PACK*BASH T95 - Friday Evening
------------------------------
A new event for the digitally-inclined ham, featuring:
* Buffet dinner (with cash bar)
* Nationally-known speakers holding forth on current topics:
* Bob Bruninga, WB4APR (Author of APRS)
```

* Dewayne Hendricks, WA8DZP
* Prize raffle
* Lots of Informal Discussion
* TAPR NET SIG and a second APRS SIG meeting

When?
Friday evening, April 28, 1995
Dinner starts at 7:00 PM, speaker at 7:45 PM
Everyone is invited to attend, but dinner is only available to those
with reservations.

Where?
TJ's Restaurant, 2462 Dryden Road, Dayton
(Dryden Road exit, I75 -- across from the Holiday Inn)
(Maps available at the TAPR booth)

How?
Dinner requires advance registration (by April 24th)
Come by the TAPR booth at Dayton to check on additional space.
Everyone is invited to come, but dinner is only available to those
with reservations.
Dinner cost is $16.00 per person, tax and tip included.

To register, contact:
TAPR (tapr@tapr.org)
Phone: (817) 383-0000, Fax: (817) 566-2544

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

(This is a replacement of the McNasty's event)

Saturday - BBS SIG Meeting

The TAPR BBS SIG will meet Saturday night at 7:00pm

Where: Radison Hotel - Premier Room
The Radison is located near the intersection of I-75 and
Needmore Rd. This is not far from Hara Arena.

New feature this year - CHAIRS !!!

This is a great opportunity to meet with fellow BBS Sysops and discuss
current events and plans for the future. TAPR membership is not a
requirement, this event is open to the public.

For more information, stop by the TAPR booth at HARA.

Tucson Amateur Packet Radio (tapr@tapr.org)
8987-309 E Tanque Verde Rd #337 * Tucson, Az * 85749-9399 * 817-383-0000

1756. NOSview 304

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-24 00:00:00 UTC
From: n9gdr@iquest.net
Message-ID: <D7IqtD.47q@dorite.use.com>
Source record: 43879

Hello,

I am currently experimenting with the NOSview software ver. 3.04, but when other stations connect to me they have to hit an extra CR to get into the system. Also, I am trying to get a local BBS to forward to me. It makes the connection but I do not receive the mail. I am monitoring with another paket station on the same freq. and notice the BBS never gets past the initial connect header. My NOS station keeps sending the RR message every time the BBS tries to "talk" to my NOS station. Has anyone else had these problems and is there a "bug" fix or patch or am I missing something. I am using a KPC-9612 and ICOM IC-281H. If a station knows to hit the extra CR then everything seems o.k. My main problem is with the BBS forwarding to me. Any help is appreciated and thanks in advanced :-)

Aninda DasGupta (add@philabs.philips.com) wrote:

: Is there a FAQ or recommended book, or any literature on packet radio?
Vast amounts! The best thing to do is to go to your local ham club; there you will find MANY people who will advise you. Many will disagree with each other, but I think it is still better than trying to do it by books!
: I am most interested in the protocols used, how it connects to the
: Internet, what API toolkits are available, how the nodes are
The connection to the 'net is illegal in many countries; I don't think it is in the USA, so there are some gateways, always voluntarily run. The owners of these gateways put out instructions on how to use them (from both sides) in this group from time to time - look out for them.
: connected, what wavelengths are used, what antennae are required, and
Most bands have a packet segment - VHF and above tends to be for local use, h. f. and satellites for longer distance (at lower speeds on h. f.).
Aerials: unless you are providing the network with a special link, and only in special circumstances then, a simple omnidirectional aerial should be used; a directional one will make you not hear signals from `behind' you, which will cause you to transmit packets at the same time as the station behind you, with the result that neither of you will be received properly by the station you are trying to address. (Packet uses shared frequencies.)
: who are the popular vendors of digital radio equipment. I have heard
I could try to say - Kantronics is one of the biggest - but your local club will be able to tell you the USA scene better than I can,
: of AMTOR (sp?). How does that tie in with things? I guess I am trying
AMTOR came before packet, and is still used, especially on the h. f. bands; it sounds like a bird chirping. I think it only uses capital letters. It can be used on direct links over some distance, I think.
: to understand the entire process (every detail) of how a message that
: I might send to a friend halfway around the world would get there and
: be retrieved by my friend. Once I understand the process, I want to
Well, the normal way is you would `connect' to your local BB, and when you get the prompt - very like using a 'phone BB - type something like SP (or S) G6JPG@GB7NNA.GBR.EU, to which the BB would respond `Enter subject', and then `enter message, ending with CTRL-Z or /EX on a line by itself'; once you have done this, the message would propagate round the world between BBs - in much the same way as it does on the internet, but taking hours (can be days to obscure bits) instead of seconds or minutes. When your friend logs into their BB, it would say something like `you have mail; type RN to read it'. The prompts and method of use vary slightly depending on what BB software the BB is using, but it is all something like that.

Of course, some amateurs use TCP/IP on the air (in fact the software used by many to do TCP/IP on 'phone lines was originally written for this, by KA9Q), in

which case it looks even more like the internet.

: buy equipment, get a license and start playing with the setup. As is

Well, there are roughly two ways of getting on the air with packet. Obviously
you need a transceiver for the band(s) on which you are licenced; for packet,
any old clunker will do - in this country, ex-private-mobile-radio sets, with
new crystals for the new frequencies and a bit of adjustment, are quite widely
used. To go with that you need either a TNC - terminal node controller - and a
dumb terminal (or computer running a terminal emulation prog.), or one of the
implementations that make the computer do most of what the TNC does, and a very
simple interface to the transceiver. (Such emulations are available for at
least the PC.) Each approach has its advantages; the PC-doing-TNC one is
almost certainly cheapest, while the TNC route allows more sophisticated things
to be done (and the performance may be a little better, especially on h. f.).
: probably evident from my questions, I am a complete novice at amateur
: radio. Any help will be greatly appreciated. Thanks!

Source record: 43883

I'm considering getting the MFJ multimode controller, and I'd like to hear from people who have used one. Would you buy on again or would you purchase a different brand. How long ago did you purchase it? (I understand there have been a number of upgrades.) I'm interested in using if for VHF packet, pactor, NAVTex, WeFax, and as a keyer.

Also, do you have any experience with MFJ's Mac software?

I would consider the AEA 232 or the KAM, but I really want grey level fax, the 9600 upgrade path, and the CW keyer. (I know the AEA unit has options for the first two.) The PK-900 and AEA DSP unit look great, but the are out of my price range.

Please e-mail responses to me. I'll summarize if there is interest.

>and have set up scanning of 144.???-145.??? MHz. Would like info
>on more frequencies to watch.
>
>Thanks in Advance
>Karl Weller

In Arizona you would want to be 145-146 on the odd/not even freqs.
The best info is in the ARRL repeater handbook as it has a packet
listing in the back.

Hi Gary,

The TNC-2 just doesn't have the features that AEA and Kantronics put in their TNCs. No GPS and similar advanced features. I firmly believe the PK-12 is the better TNC.

Bill

Date: 1995-04-25 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-2504950509280001@wd1v.mv.com>
Source record: 43700

NEW.FREE."Macnet Roster" HyperCard Stack

"Macnet Roster" (ver. 663) has just been updated and lists the ham call sign, home bbs, email address, name, address, and stats of every known amateur radio operator in the world that uses a Mac computer. The version number is the number of entries.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, hints and kinks, and make new ham friends that use the same computer you do.

If you'd like the latest "Macnet Roster", you have 2 options:

1) send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

2) If you are on America On Line, send me EMAIL requesting the latest version and I will send it to you.

Put YOUR INFO (via EMAIL or disk) if you'd like to be included in the "Macnet Roster".

You can send an update to your stats to me via pkt or email anytime.

73,

You should contact Larry Lucas at the Texas Center for Educational
Technology (llucas@tenet.edu). We have developed several publications
on the subject you are interested as well as TCET has been working in
this area of curriculum for several years now. Teacher Training and the
like.

Also, Rosalie White at the ARRL is a very good contact on the subject.

Source record: 43704

phaedra@netcom.com (Paul and Jill) writes:

> I need to know how to send mail from the Internet to a user on Packet. I
> am a licensed operator, but I cant cough up enough ca$h right now to buy
> a TNC. Is there such a gateway???

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

I believe the new version 7.1 firmware does allow monitoring of a g-tor
qso.

Also, for those of us who type 80+ wpm and are always getting ahead of
the send buffer, when that g-tor compression kicks in it leaves pactor
waiting in the dust. For sending traffic and/or files pactor can't
compare. For general ragchewing neither is superior, IMHO.

This is true, but it was only possible using the Gmon program, which could do nothing BUT monitor gtor. This is a serious handicap since you would have to start up your other program to actually transmit or change modes. Also, gmon was a real pain in the yahoo to actually use. As I said in a previous post, I believe the new 7.1 firmware allows monitoring using host mode programs such as the NEWEST version of KaGold or Hostmaster. Somebody please correct me if I'm wrong. :)

Phil regarding the MFJ tnc,I once owned an MFJ 1278b with the pactor option and in my opinion it is a jack of all trades and master of NONE. The software sold by MFJ is "JUNK".The manual does explain all the functions if you have the time and patients to stay with it.The learning curve with the tnc is easily 10 times longer than with others.Back to the software,it operates as if it were written 5 years ago or longer with each part patched in rather than integrated into the whole.The XPCOM program makes the basic functions work well but as far as the CW and SSTV modes you are at MFJs' mercy.The filtering is below par at best and I have had about a 20% sucess rate trying to work pactor.I was ready to give up the digital modes until i tried the PK-900 which preforms very well and has great software support.As my dear old Grandmother used to say,"You get what you pay for stay away from MFJ".

Johan supposedly is working on a version of JNOS which will run under NT. Otherwise, it is fairly trivial to write a .pif file to run JNOS in a DOS window (the pif is necessary if you want it to multitask decently).

>Kantronics released monitoring software with the first release.
>Have you _any_ experience with this or are you getting your information
>from a third party? If it is third party, do call Kantronics before going
>off half cocked.

Steve, I stated in my very first comment to this thread that certainly
I was aware GTOR monitoring could be done in outboard software. My exact
words were:

Okay, yes, I know, you can do the monitoring in software outside
the KAM, but come on: that's a complete cobble. This should have
been in the KAM itself.

I'm certainly not any more half-cocked than someone who takes issue with
my comments without even knowing what they are.

My point then and my point now is that in my judgment -- and what the
heck, I have a right to my opinion :-) -- any answer that depends on
outboard software to decode this protocol for monitoring is not an
answer. One reason is that just because there's a program out there to
do it outboard doesn't mean it's going to run, or at least, not acceptably
on every machine. In fact, Kantronics even admits that in the manual.

And you know what? I think the marketplace as a whole is going to come
to the same judgment. You may think this is just the greatest thing since
flush toilets but it just doesn't cut for me and I don't think I'm going
to be alone. Monitoring is base functionality that should have been
built right into the KAM.

Kantronics blew it. Maybe they'll get it right in the next release.

>
>The TNC-2 just doesn't have the features that AEA and Kantronics put in their
>TNCs. No GPS and similar advanced features. I firmly believe the PK-12 is
>the better TNC.

Not so. PacComm offers a Tiny 2 complete with an internal GPS receiver.
The latest release of TNC-2 firmware fully supports GPS and APRS styles
of operation with *any* NEMA-183 device, GPS, Loran, etc. That firmware
will work in *any* TNC-2, all the way back to the original TAPR kits.
With a TNC-2 based unit, you are not locked into firmware support from
only one manufacturer. With Kantronics and AEA you are totally dependent
on the manufacturer to provide support for new modes or upgrades. That
doesn't mean they are bad products, of course, but they limit your options
and upgrade possibilities. For example, Kantronics says they have no
intention of ever offering a 9600 upgrade for the KPC-3. They want you
to shell out $200 for another TNC, their KPC-9612, instead. Meanwhile
any TNC-2 can be upgraded to 9600 using a modem board from a number of
third party vendors.

If you are content to treat your TNC as a black box, and are willing
to buy an entire new black box for every new feature that comes along,
then the Kantronics/AEA proprietary designs may be just the thing for
you. But if you want the widest possible flexibility, upgradability,
and cost efficiency, then a TNC-2 design remains the better choice.
It's philosophically PC versus Mac. Do you want an open architecture
or a closed one?

All of this is really moot for most high performance users, of course.
There are direct bus plugin cards that offer much better performance
than any TNC, bottlenecked by a serial interface, could ever hope
to provide. Both the Gracillis PacketTwin and the Ottawa PI2 cards
are much better ways to go if you are using a PC.

Karl, in the Cleveland OH area, try (among others):
144.910 NODXA PacketCluster
145.010 Wide-Area packet
145.050 CLEWX WeatherNet and several BBSs
145.070 Several BBSs
145.090 ARC-CLE and several BBSs
145.730 A few BBSs (including NO8M - Western Suburbs)
145.790 APRS-Position Reporting Networks

I see that your parents also knew how to spell our name korrektly!

Hi All!

I'm trying to setup a packetprogram called TSTHOST with a BPQ-driver. To do
this i have to use the driver DEDHOST.

Problem i have is That i can't get any monitoring (i can Connect). If anyone
has a solution or maybee the file DEDHOST.DOC ore similar pse get in touch.

Hi,

I have a paper copy of the AX25 protocol, but :
- it's quality is not good (copy of a copy of a copy)
- I'm not sure it's the last release
- I should want to send it to a school working on a packet project

So, I should want to know if I can find it on the Net.

Thanks by advance

Greetings, all..

I have a couple of shiny new Kenwoods with a Mini-DIN data port
on the back. The docs say data-in, data-out, etc., but no mention
of a PTT line ! Does this mean that the audio and PTT are together
(like a handheld) or does the rig have some fancy DCD circuit to key
it automatically, or am I barking up a tree ?? <g>

TIA,

Jim Barber (N7CXI)

Hi.

If You have the TH79E (Europe) model you only have to cut the little green wire neer ctcss module (if you have one). If you have the American model - then its not so easy. You need to find your desolder tools and the diagram you got with the radio (and some tecnical skills and luck). At the bottom to the right there is a sheme with some diodes (d303-d308) and two resistors and the green wire (W301). Now you only have to figure out witch diodes to remove. I beleve that the american model is in the first line (K,P) and the european in the 3. (T,E) line. Try to compare! I haven't the courage to do it with my own yet, so i leave the rest to you.

I agree 100% about this being a serious shortcoming, especially as I don't normally use an IBM clone, BUT there is no mention in the v7.1 addendum sheet about any improvement to the monitoring of G-TOR. The only significant difference is that the thing can be in a new TOR standby mode, and respond to connects in AMTOR, PACTOR *or* G-TOR without already having to be set into the appropriate mode. This is used to good effect by the GB7PLY TOR/PACKET BBS in Plymouth, SW England, for example.

I do not know about AEA TNC's dropping out of Kiss mode. I run two of them on a 24 hour basis
here, a PK-232 with the Tapr 9600 modem installed and a PK-96. Have had power failures here and
each time the computer booted and the TNC's were fine. Never saw one drop out of Kiss. I use the
battery backup in the TNC to keep KISS on. Now in the Seattle area we have 4 9600 baud full duplex packet repeaters on line, here there were two MFJ taper 2 TNC's and both experienced problems dropping out of kiss. I run a full blown JNOS station here soon the be Linux You should
be able to get my 440 station in a telnet at 44.24.110.8, as we have a real nice internet connection here.

1797. GTOR, Pactor protocols?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-26 00:00:00 UTC
From: garym@alsys.com
Message-ID: <D7nLJ3.HIq@thomsoft.com>
Source record: 43730

Where can I find a description of the protocol used by GTOR and PACTOR?

We're interested in setting up a digital communication link between our County EOC and our mobile communications van using NVIS on HF. The rough terrain in San Diego county makes VHF/UHF comm difficult in many areas.

We would like to evaluate these protocols for possible use in this application instead of simple HF packet or AMTOR. We would like to link our computer at the EOC with the computer in the comm van for transferring messages or files (under 20kb). We also plan to use data compression on the link, so a protocol that supports 8 bit data is a plus.

References would be appreciated.

>KaGold or Hostmaster.

Well, it's not in the docs _I_ got with my 7.1 update. Then
again, *lots* of things aren't in the docs I got. My 7.1 docs from
Kantronics consisted of another copy of the old 68-page 7.0 doc which
I already had + an errata sheet for 7.1 which I had to cut up
and Scotch tape into place in the manual! (Kantronics certainly
has my vote as producing, bare none, THE WORST, most unusable,
most incomplete documentation in the entire computer industry.)

All I have is a brief entry in that dictionary-like section of the manual
for the GSCAN command for use with gmon.exe or goff.exe -- and this was
unchanged from 7.0. Even if were so inclined to write my own monitor,
there's certainly not even enough detail here to allow me code anything.

If indeed the latest versions of KaGold or Hostmaster do happen to
incorporate GTOR monitoring, my guess is that it was probably
done just by somehow recreating the gmon.exe functionality directly into
these programs, not by taking advantage of any new 7.1 functionality
in the Kam Plus.

A couple of us have been running WinSock over our fast IP backbone. So far, other than standard mail, file transfer, ping and finger about the only "different" thing we've done is to play WinChess over the network and try out Internet Global Phone audio. IGP audio isn't stellar in quality but I managed to send to k6hsj, Bob Dickson, "Mr. Dickson, come here, I want you." and he understood it (:>)

We also run Mosaic and Netscape over the system. At the ends there are a JNOS machines providing SLIP or Ethernet connection to the Windows machine.

For regular packet I use the TERM program that comes with Windows.
Its not fancy but it works.
For TCP/IP I am running JNOS ver 10h in a DOS box under windows. Use
a NOS.PIF file to start the program. Mine has the following
parameters set:
Memory KB Req: 480, Desired 640
EMS and XMS Req 0, Desired 1024
Display Usage Windowed (this allows you to get to other window task
and display them.
Execution = background checked.
You should be able to leave the Advanced parameters alone. I think
these are pretty standard for DOC PIF files. I have been warned that
if the machine gets heavily loaded (not hard in windows), you may
start loosing data.
NOTE: I have not used this extensively (I'm new to TCP/IP), but it
appears to work. This is not the same as running a real windows
TCP/IP stack, all the neat Winsocket stuff will not work with it. But
if you have to run windows it seems to work.

> a TNC. Is there such a gateway???

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

Can't help you re a net copy, but I believe the original publication is by TAPR and called something like "the AX25 link-layer protocol", or something equally unexciting. It should be available through most national radio societies such as ARRL, RSGB, DARC etc., (sorry, not sure what the French equivalent organisation is).

>connection here.

The PK-232 doesn't drop out of KISS in my experience, but the KPC-3
does. However, the PK-232 barfs on frames larger than 255 bytes. We
use a frame size of 4096 on our high speed MAN, and the PK-232 simply
won't play. As I suggested in my note, use of the K3MC KISS-only code
in the TNC-2 *assures* it can't drop out of KISS. (We actually use
a modified version called KISS-56 on our MAN, but the effect is the
same.)

Hi,

I have a paper copy of the AX25 protocol, but :
- it's quality is not good (copy of a copy of a copy)
- I'm not sure it's the last release
- I should want to send it to a school working on a packet project

So, I should want to know if I can find it on the Net.

Thanks by advance

Gary Morris @ignite (garym@alsys.com) wrote:
: We're interested in setting up a digital communication link between our
: County EOC and our mobile communications van using NVIS on HF. The rough
: terrain in San Diego county makes VHF/UHF comm difficult in many areas.

Hi Gary ...

The conditions are about the same in Ohio. We have a very hilly SE
quadrant of the state that is sparcely populated. As such, VHF communications
are very difficult.

A fellow named Tony, AA8EI@KC8TW.#CIN.OH.USA.NA has been very active
in testing and using NVIS antennas. I have a ten part series about that
which he either authored or flooded.

A friend and I (and our families) spend a lot of time camping. Most
of our operation is within 500 miles of home. We use HF to keep in
contact with home. MSYS is used by virtually all BBS systems near Cleveland
and a number of those systems utilize both Pactor and G-TOR ports. The NO8M
BBS has both a Pactor and a G-TOR port which is connected to a radio which
scans a number of bands.

I found HF packet to be extremely difficult to maintain. The addition
of Pactor took a near hopeless situation and changed it to one which allows
me to connect to home at will. G-TOR, 80 and 40 meter G-TOR, has then allowed
us to connect and have great throughput. My experience in acutally using
Pactor and G-TOR (heavy use) has shown that I can connect to home anytime
(24 hours a day) in about 75% of the time when I am within 500 miles of home.
I also have observed that if I limit myself to the hours between 0900 and
2100 local time, my connect possibilities go to well over 90%.

I also found the benefits of NVIS. I used to take a full size vertical
which was configured for an easy set up. I found that a Hustler mobile
mast mounted on a luggage rack would perform virtually identical to the
full size whip. In fact, in many cases, the whip would outperform the
vertical due to the selectivity it provided by limiting the areas heard.
I have seen little difference in the whip against a portable dipole.

Don't spend a lot of time with anyone who is not using the mode.
The biggest doomsayers are those who's discussions are limited to their
theoretical knowledge.

Had to call Kenwood Tech Support for the answer to this one. Seems the manual calls the PTT pin Packet Standby (go figure that out!). Pin #3 works fine with my TM255/455 and PK-900.

Good luck and hope this helps.

garym@alsys.com (Gary Morris @ignite) writes:

>Where can I find a description of the protocol used by GTOR and PACTOR?

There was a fairly decent article on G-TOR in QEX, May 1994, pp 12-19, titled "G-TOR: A Hybrid ARZ Protocol for Narrow Bandwidth HF Data Communication" by the Kantronics guys who designed it. This article does give a fairly detailed overview of the protocol, including the frame structures and timing used. Frankly, it was based on this article that I myself got pretty enthused last year about the prospects for G-TOR -- 'till I got it and realized the current generation of TNC's lack G-TOR monitoring ability, which I find to be a crippling limitation.

Re: PACTOR, I wish I could make a suggestion. The ARRL's "Your RTTY/AMTOR Companion" gives only enough technical information to allow you to hand-wave and impress your wife and kids. Maybe someone else has a better reference.

BayPac...

Anyone have a phone number or address whereby I can get more info on
their new TNC? I'd like to get a TNC soon, and their new one is smaller
than the KPC-3, supposedly about the size of a deck of cards.

I'd like to get info on it such as battery duration, prices, etc..

TIA

Hmmm, this isn't the first time I've heard mutterings about Kantronics units dropping out of KISS mode. I know it's slightly off the original topic, but I'd very much like to hear from anyone who is using Kant. units in KISS mode, successfully or otherwise.

Further to that, has anyone had problems with software DCD on Kantronics units when in KISS mode?

Thanks and 73

Source record: 43747

I have a copy of AX25 Level 2 version 2.2 dated July 1993. As I've
forgotten where it came from, readers may obtain a copy by sending
a blank message to ax25spec@lightfox.demon.co.uk

Beware - this doc is over 180k long !!

Also available is a doc on interfacing a Kantronics DVR 4-10 and a
KPC 9612 - this is written with KISS users in mind. A message to
kan9k6@lightfox.demon.co.uk does the dirty deed.

In my experience, some requests sent from ampr.org stations tend to get
to this site, but the specified document is often undeliverable.

Cheers,

Gareth.

1815. KaWin web and ftp site now up - REALLY!

Newsgroup: rec.radio.amateur.digital.misc

From: stan@mutadv.com
Message-ID: <stan.50.00B847D5@mutadv.com>
Source record: 43748

OK. Really! It's really OK, now!

To my infinite horror, my internet supplier scheduled a disk crash to coincide with the release of KaWin, Well, perhaps "scheduled" is stretching it a bit. But, when they brought the ftp.csn.net system back on line yesterday, it was with old backups. They then allowed all anaonymous access to begin, but held off client access (write access) until this afternoon. Go figure?

Anyway, the KaWin FTP area is now restored, tested and ready for the world! Sorry for the inconvenience, but I'm certain you will find KaWin well worth the wait.

KaWin is the window to the world of digital amateur radio for users of Kantronics TNCs and MS Windows. Host-mode multi-TNC, multi-port, multi-stream, multi-mode!

KaWin home page: http://www.mutadv.com/kawin/
or
KaWin FTP site: ftp.csn.net in the /kawin directory

Subject: Hams with Macs dBase - Free

NEW.FREE."Macnet Roster" HyperCard Stack

"Macnet Roster" (ver. 663) has just been updated and lists the ham call sign, home bbs, email address, name, address, and stats of every known amateur radio operator in the world that uses a Mac computer. The version number is the number of entries.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, hints and kinks, and make new ham friends that use the same computer you do.

If you'd like the latest "Macnet Roster", you have 2 options:

1) send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

2) If you are on America On Line, send me EMAIL requesting the latest version and I will send it to you.

Put YOUR INFO (via EMAIL or disk) if you'd like to be included in the "Macnet Roster".

You can send an update to your stats to me via pkt or email anytime.

Kantronics released monitoring software with the first release.
Have you _any_ experience with this or are you getting your information
from a third party? If it is third party, do call Kantronics before going
off half cocked.

Steve, I stated in my very first comment to this thread that certainly
I was aware GTOR monitoring could be done in outboard software. My exact
words were:

Okay, yes, I know, you can do the monitoring in software outside
the KAM, but come on: that's a complete cobble. This should have
been in the KAM itself.

I'm certainly not any more half-cocked than someone who takes issue with
my comments without even knowing what they are.

My point then and my point now is that in my judgment -- and what the
heck, I have a right to my opinion :-) -- any answer that depends on
outboard software to decode this protocol for monitoring is not an
answer. One reason is that just because there's a program out there to
do it outboard doesn't mean it's going to run, or at least, not acceptably
on every machine. In fact, Kantronics even admits that in the manual.

And you know what? I think the marketplace as a whole is going to come
to the same judgment. You may think this is just the greatest thing since
flush toilets but it just doesn't cut for me and I don't think I'm going
to be alone. Monitoring is base functionality that should have been
built right into the KAM.

Kantronics blew it. Maybe they'll get it right in the next release.

Hi Mike,

Before you do anything else get a copy of the April 95 QST (I think that is
the right issue). It has a great article compairing the various 9600 baud
radios. Sure tells you in a fast way which radios are better than others. As
far as I know all of the 9600 baud TNCs work. You sure can't say that about
all of the radios!

Bill

From: sohn@apple.com (a phil sohn)
Subject: MFJ-1278B Experiences?

I'm considering getting the MFJ multimode controller, and I'd like to hear from people who have used one. Would you buy on again or would you purchase a different brand. How long ago did you purchase it? (I understand there have been a number of upgrades.) I'm interested in using if for VHF packet, pactor, NAVTex, WeFax, and as a keyer.

Also, do you have any experience with MFJ's Mac software?

I would consider the AEA 232 or the KAM, but I really want grey level fax, the 9600 upgrade path, and the CW keyer. (I know the AEA unit has options for the first two.) The PK-900 and AEA DSP unit look great, but the are out of my price range.

Please e-mail responses to me. I'll summarize if there is interest.

From: "Walt (N3JPR)" <lrpst5@pitt.edu>
Subject: MFJ-1278B Experiences?

Phil regarding the MFJ tnc,I once owned an MFJ 1278b with the pactor option and in my opinion it is a jack of all trades and master of NONE. The software sold by MFJ is "JUNK".The manual does explain all the functions if you have the time and patients to stay with it.The learning curve with the tnc is easily 10 times longer than with others.Back to the software,it operates as if it were written 5 years ago or longer with each part patched in rather than integrated into the whole.The XPCOM program makes the basic functions work well but as far as the CW and SSTV modes you are at MFJs' mercy.The filtering is below par at best and I have had about a 20% sucess rate trying to work pactor.I was ready to give up the digital modes until i tried the PK-900 which preforms very well and has great software support.As my dear old Grandmother used to say,"You get what you pay for stay away from MFJ".

From: n9gdr@iquest.net (Mark Shaffer)
Subject: MOTOROLA MAXAR MODS

Hello and thanks for reading my query,

I am experimenting with a Motorola MAXAR model 80 transceiver and I want to use it at 9600 baud. Can anyone tell me what the mods are for this

particular radio to accomplish packet at 9600 baud ? I am familiar with
the mods to the Motorola Mitrek series radios and have those on the
QRZ CD-ROM series. Any help would be appreciated and thanks again in
advance.:-)

Subject: Need examples--Packet & Education

You should contact Larry Lucas at the Texas Center for Educational
Technology (llucas@tenet.edu). We have developed several publications
on the subject you are interested as well as TCET has been working in
this area of curriculum for several years now. Teacher Training and the
like.

Also, Rosalie White at the ARRL is a very good contact on the subject.

Cheers - Greg, WD5IVD

>Thanks in Advance
>Karl Weller

In Arizona you would want to be 145-146 on the odd/not even freqs.
The best info is in the ARRL repeater handbook as it has a packet

listing in the back.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

Subject: TAPR Activities at Dayton

TAPR Activities at Dayton '95

Dayton is almost upon us and here is the list of TAPR activities and events
happening during Dayton. We hope to see lots of folks around and please
stop by the TAPR booth and say hi!

TAPR Booth

The booth is located at the same location as the last several years. We
should have most items and kits available and another big membership offer
will be available to new members! Come by and say hi to the TAPR gang and
if you want, help out behind the table. The more the merrier.

Regional Groups Note: If you are with a regional digital group, please stop
by and chat with Greg Jones, WD5IVD about how TAPR can do things with your
regional group. There will also be a place at the booth to place regional
materials, so if you have something to hand out, drop it off.

Friday - TAPR Digital Forum

1:00pm - 1:45pm Introduction to Digital Communications
Greg Jones, WD5IVD
1:45pm - 2:00pm TAPR Update
John Ackerman, AG9V
2:00pm - 2:30pm Layer 1 and Radio Issues
Mel Whitten, K0PFX
2:30pm - 3:00pm TAPR/AMSAT DSP-93 Project Update
Bill Reed, WD0ETZ
3:00pm - 3:30pm TCP/IP Issues and Trends
Barry McLaren, VE3JF
3:30pm - 3:45pm BBS Issues and Trends

Barry Buelow, WA0RJT
3:45pm - 4:00pm HF Digital Communications Trends

4:00pm - 4:30pm APRS
Bob Bruninga, WB4APR
4:30pm - 5:30pm TAPR APRS SIG
Keith Sproul, WU2Z

PACK*BASH T95 - Friday Evening

A new event for the digitally-inclined ham, featuring:
* Buffet dinner (with cash bar)
* Nationally-known speakers holding forth on current topics:
* Bob Bruninga, WB4APR (Author of APRS)
* Dewayne Hendricks, WA8DZP
* Prize raffle
* Lots of Informal Discussion
* TAPR NET SIG and a second APRS SIG meeting

When?
Friday evening, April 28, 1995
Dinner starts at 7:00 PM, speaker at 7:45 PM
Everyone is invited to attend, but dinner is only available to those
with reservations.

Where?
TJ's Restaurant, 2462 Dryden Road, Dayton
(Dryden Road exit, I75 -- across from the Holiday Inn)
(Maps available at the TAPR booth)

How?
Dinner requires advance registration (by April 24th)
Come by the TAPR booth at Dayton to check on additional space.
Everyone is invited to come, but dinner is only available to those
with reservations.
Dinner cost is $16.00 per person, tax and tip included.

To register, contact:
TAPR (tapr@tapr.org)
Phone: (817) 383-0000, Fax: (817) 566-2544

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

(This is a replacement of the McNasty's event)

Saturday - BBS SIG Meeting

The TAPR BBS SIG will meet Saturday night at 7:00pm

Where: Radison Hotel - Premier Room
The Radison is located near the intersection of I-75 and
Needmore Rd. This is not far from Hara Arena.

New feature this year - CHAIRS !!!

This is a great opportunity to meet with fellow BBS Sysops and discuss
current events and plans for the future. TAPR membership is not a
requirement, this event is open to the public.

For more information, stop by the TAPR booth at HARA.

Hi Gary,

The TNC-2 just doesn't have the features that AEA and Kantronics put in their TNCs. No GPS and similar advanced features. I firmly believe the PK-12 is the better TNC.

: gets past the initial connect header. My NOS station keeps sending the
: RR message every time the BBS tries to "talk" to my NOS station. Has
:
anyone else had these problems and is there a "bug" fix or patch or

Fix what bug? You have a healthy NOS box, what you need to do is get the BBS
to send a cr after the RR to wake up the port. It need to know what
protocal is being spoken.

Alternative to this tell your end that anything that connects to the port in
use is ax25.

All NOS prgms are the same. So nothing is broken or buggy. Suggest you have
a read of some Network Admin and Network Users Guides. Any one that
mirrors the TARP or KA9Q should be able to help you..

Last have another read of the docs, they are usually badly written,but the
infomation is somewhere in them, that you need.

: am I missing something. I am using a KPC-9612 and ICOM IC-281H. If
: a station knows to hit the extra CR then everything seems o.k. My
: main problem is with the BBS forwarding to me. Any help is appreciated
: and thanks in advanced :-)

What software is the BBS using?
FBB+NOS+BPQ ? yes then use smtp,nntp
MSYS ? though IP wise brain dead it works sorta.

TNC-2 has GPS NMEA beacon parsing. Please keep up to date - lots of
folks read this newsgroup.

Source record: 43758

After MUCH footwork I've been able to gather details on this new product
... you could do so yourself via WWW or email to Baycom in Bayern -
Deutchland (Bavaria-Germany) The "Bay" comes from the Bayern it seems!

email baycom@baycom.de or World Wide Web http://www.baycom.de
----- --------------

The kit (PAR96) sells in various forms - assembled,key parts only etc.

* Connects with parallel port, giving 9600 bps - AT 10MHz minimum P.C.
* 100% G3RUH compatible FSK * Size 100mm x 100mm x 30mm
* Needs 8-13V 160mA, or 5V 160 mA * Runs regular BayCom Ver 1.6
* Radio needs to be modified to accept sub D9 connector

Hope this helps corner the beast ! 73s de ZL2AJZ in New Zealand

I tried the kawin program, and find it very well done. It has a professional feel about it. Some of the page flipping is pretty slow (config, etc) but that's the Visual Basic problem I'm sure.

After evaluating it this afternoon I finally got mad at all the "nagging" for me to pay for the software. There has to be a better way to allow people to evaluate something and protecting your investment. I finally went back to YAPP, as it does essentially the same thing. I like the way kawin does the multiple connections, however. If you've used MS-Word and its configure, then you'll recognize the file cabinet manilla folder icon with its raised index. There's some weird stuff with the TAB key. When you hit TAB the color changes to black, I never figured out why. Normally it defaults to blue on white, but can be configured. If you're into host mode you should at least give it a try, and decide for yourself. I only had one error which said I should report it to the author, but I didn't save my fault tree. Somehow I hit the Window option at the wrong time. It gracefully recovered however.

There sure is (are). There should be a LOT of gateways around. For
example, here in Vancouver, we have 2 that I am aware of, both local.
The mail can stream both ways. For example, I can send a message, via
packet, to my father-in-law, who is not a ham, and vice-versa. Check
with your local packet network to se if you have any gateways in your
area.

1829. KA9Q NOS & Warp ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-28 00:00:00 UTC
From: wilson_jo@grpr21.dnet.bp.com
Message-ID: <1995Apr28.033139.1829@rcwusr.bp.com>
Source record: 43762

I'm presently running KA9Q NOS under OS/2 2.11 (it's the DOS version)- no problems at all. Last night, I decided to upgrade to Warp. After the upgrade, using TRACE, I get a lot of CHECKSUM errors, which I never had with OS/2 2.1. I'm opening the port to the TNC at 9600 baud, and I am not using SIO, or any other COM driver.

Has anyone else got this problem, or it is just me?

John.

Digital Scope.FAQ - Version 1.05

Spring, 1995

Dear Technologist:

This Digital Scope.FAQ file contains many of the answers to the "frequently asked questions" regarding digital scopes.

Key Issues reviewed in this file include:

* DSO INDUSTRY TRENDS (1995)
* PRIMARY DSO FUNCTIONS
* APPLICATIONS
* DISPLAYS
* MEASUREMENTS
* BANDWIDTH & TRIGGER
* DIGITAL SIGNAL PROCESSING <DSP>
* ARCHIVAL & MEMORY
* ADCs
* DEMOS & PURCHASING

Feel free to contact me anytime via Internet (john@wd1v.mv.com) if you have comments, questions, or want the latest version of this file sent to you.

*DSO INDUSTRY TRENDS 1995
More DSOs are now sold than analog scopes. Expect most new scope models to be DSOs and expect them to have faster sampling, higher bandwidths, deeper memories, and lower costs than you might expect. Comparable models have fallen in price by about 50% in the last 4 years. The market is very competitive and that is good news for buyers.

DSOs aren't just for transient capture anymore. Modern DSOs can now process multiple sweeps and generate envelopes, measure statistics of how your signals are varying over time, do simple to complex DSP functions, conduct stand alone tests, archive and print data, even FAX scope screens with measurement and test results to/from remote sites.

DSOs now are the highest BW oscilloscopes available. The highest BW analog scope currently in production is 400 MHz. DSO BW specifications exist > 4 GHz from several manufacturers.

Closeness to sources is also good news for buyers. The vast majority of the DSOs that are sold in the United States are manufactured by US Corporations making delivery, service, and support easier and less expensive.

DSOs are getting more and more computation intensive. Deep memory, multiple channels, large high resolution displays, and enhanced DSP routines tax the

fastest CPUs and smartest firmware. Latest designs use multi-processor architectures.

Upgrade paths for firmware and hardware expansions are becoming more common.

DSOs are now available in 5 different distinctive form factors:

1 PC Card - A to D on a card that uses PC's CPU and memory- PCB Style
Interesting due to low cost. Look out for noise problems from some PC's backplanes.

2 Stand Alone Card - DSO on a card for embedded systems - PCB Style
Interesting due to low cost, small size, fewer noise issues.

3 Handheld - Portable capabilities - Portable Style
Battery operated for field measurements

4 Portable - with some amount of upgrade capabilities - Portable Style
Performance approaching mainframes and low cost due to high competition, high volume, and large scale integrations.

5 Mainframe - typically with plug-ins that determine performance - Lab Style
Highest cost but highest performance and greatest versatility.

REAL TIME SAMPLE RATES (Single Shot) > 10 Giga-samples MEMORY DEPTHS are expanding from 1 K samples to > 8M samples per sweep

DSOs are the primary debugging tools for high speed digital circuits since they can now sample so rapidly and trigger on so many different fault conditions.

Some DSO manufacturers are offering COLOR display options. Higher end versions utilize the colors cleverly with COLOR GRADED PERSISTENCE.

While many applications only require a single channel scope, most users are now purchasing 4 channel DSOs with easy justifications. The additional cost is usually small, they appreciate the "what if I need it" capabilities, and the wider trigger and debugging capabilities to look at > 2 inputs.

Some manufacturers INTERLEAVE the CHANNELS of their DSOs so that, for example, in a 2 channel model, twice the sample rate is achieved when using just 1 channel compared with both channels being used.

Some manufacturers are able to CASCADE the MEMORIES of their DSOs so that, for example, in a 2 channel model, twice the memory depth is achieved when using just 1 channel compared with both channels being used. The benefit is twice the recording time at the maximum sample rate.

Some manufacturers are just now able to both INTERLEAVE the channels AND CASCADE their memories.

DSOs are getting smaller in size, smaller in cost, and larger in functionality. This means that while you might be able to afford more DSOs and they will take up less space, it might take you longer to use them to their full potential. Thus, the user interface is gaining increasing importance. Features need to be extracted as needed quickly without a lot of button pushing, knob twisting,

and frequent trips to the user's manual. What is best for you is what feels most intuitive, easy, and convenient.

DSOs with floppy disk drives are the rule vs. the exception. Almost all new units
offer them - either as options or as standard features.

Most DSO manufacturers offer a number of FREE services:
o Full line catalogs and price sheets
o DSOs for evaluation on your signals with a "how to use it" demonstration
o Application Notes that relate how to take specific measurements or tests
o Seminars to teach basic digital scope technology
o Seminars to teach application specific techniques
o Competitive DSO Comparisons
o Training after delivery for most rapid return on investment
o Toll-free telephone applications assistance to support their platforms
o Drivers for third party software used for remote control and analysis.

*PRIMARY DSO FUNCTIONS
o Archival <Save the waveforms, measurements, tests, etc. to storage media or host>
o Auto-Setup <Sets the instrument up automatically on repetitive waveforms>
o Capture Repetitive Waveforms <Trigger on repetitive waveforms>
o Capture Transient Waveforms <Single shot captures>
o Compute Statistics <Compute variation in waveform(s) measurements>
o Data Transfer <Pass data to/from a host for processing, archival, etc.>
o Find Features <Find where specific data values are (e.g. max.) >
o Make Measurements <Compute values contained in the waveform data>
o Make Tests <Compare predicted results with actual measurements>
o Publications <Print/plot to paper, transparency, disk, etc.>
o Trigger <Detect and trigger on EDGES, WIDTHS, INTERVALS, N# of EVENTS, etc.>
o Trigger Delays <Pre or post precise delays from the trigger>
o View the Data <See the waveforms and visually assess its qualities>
o Waveform Digitizing <Acquiring analog signals and creating digital data>

*APPLICATIONS
Due to expanding primary functions and capabilities, DSOs lend themselves to a wider variety of application areas. Like a computer, the more applications you can use an instrument for, the more valuable it is and the easier it is to justify. Here are a few for you to consider:

o The most obvious one is to use a DSO as an Oscilloscope. Typical applications are electronic circuit design and debug and troubleshooting faulty or intermittent circuits.

o Another common application is as the front end of a Data Acquisition System. DSO's cost per channel has become very competitive. Many people find that the triggering flexibility, deep memory, "live" view of waveforms, and fast transfer rates make the DSO a great candidate. If your experiment is short lived, it is nice to have a scope when you are done vs. a black box that gets shelved and forgotten. Typical applications are research experiments, process

monitoring, and flaw detections.

o DSOs lend themselves to being fully integrated into an ATE System. In this example, the DSO is under remote control from a host computer and conducts its business by computer command. Typical applications are incoming Quality Assurance of components, Manufacturing/Production Functional Test, Final Test, and System Test.

o DSOs can be used (card level or portable rack mounted form factors) and can be embedded into systems that require Analog to Digital conversion and data analysis. Here the DSO is used as a SYSTEM COMPONENT and eliminates the need and time of engineering custom devices.

o DSOs displace/replace many dedicated instruments. You'll see DSOs applied today for all sorts of measurements that used to be taken with specific instruments. Some of them are DMMs, Spectrum Analyzers, Impedance Analyzers, Time Interval Analyzers, Frequency Counters, Counters, Power Meters, etc.

o Some of the common DSO Application fields include:
Aerospace
Automotive Electronics
Avionics
Chemistry
Computer Backplanes/Interfaces
ElectricalComponents
Electric Power
EMP/EMI/EMC
LASERS
Lightning Studies
Magnetic Media <Disks>
MATE
Medical
NDT
Networks/Communications <ATM, FDDI, Ethernet, AX.25,etc.>
Noise/Acoustics
Power Supply Design/Manufacturing
Process Control
RADAR
Semiconductor Design/Manufacturing
SONAR
Telecomm (Switches, Cellular,Telemetry)
Ultrasound Vibration/Mechanical Analysis

*DISPLAYS
Not all DSOs are created equally - especially their displays. The best compact an entire sweep of acquisition memory onto a single screen with a min/max algorithm. The benefit is that you don't have to page thru screens to see the interesting details in your data. Min/max compaction makes faults obvious.

Ideally, the screen will be large enough so that you can see the waveforms AND measurements clearly at the same time. Look out for small diagonal measurement

displays that put measurements on top of the waveform data.

DSO displays are typically specified in terms of resolution and diagonal size. The higher the resolution, the easier it will be to see fine details and the better your publications that have imported DSO screens will appear. The larger the diagonal size, the greater the chance of being able to see critical information on screen all at the same time vs. pages of menus.

Ideally, you should have all the information on screen that you want in your report. Consider things like trigger parameters, ICONS, measurements, input and timebase settings for each trace, sample rate, cursors and their measurements for each trace, clock/calendar. That is a lot of information on screen. How does it look?

Ideally, you should have the ability to EXPAND or ZOOM in on DIFFERENT PARTS of your waveforms to see details more clearly and to limit your measurements to within a given region of data. This means MULTIPLE EXPANSION WINDOWS are best.

Ideally, the graticule <grid> should be done in software and allow multiple traces to be displayed, each within their own grid. This preserves the full scale voltage input ranges for best accuracy.

Ideally, the DSO display should have a report of what the front panel status is so that the entire setup of the front panel can be observed, verified, and potentially printed.

*MEASUREMENTS
No more fingerprints on the screen from counting grid squares! Modern scopes display precise measurements of any waveform you capture. The "classic" scope measurements are either made with cursors or automatically in a modern DSO.

ABSOLUTE AMPLITUDE at a given point

ABSOLUTE TIME <from trigger> at a given point

RELATIVE AMPLITUDE <difference in amplitude between any 2 points>

RELATIVE TIME <difference in time between any 2 points>

Ideally, EACH TRACE should have its own set of cursors for SIMULTANEOUS measurements on all displayed traces.

You should be able to make measurements automatically on all displayed traces.

Pay close attention to the DSO's ability to detect and measure signals that are changing. This is often overlooked and yet it is often the most needed capability.

Ideally, the measurements should include STATISTICS so you can see and measure how much your waveforms are changing with every new trigger.

*BANDWIDTH & TRIGGER
Bandwidth – BW is the amount your signal will be attenuated by the DSOs front end amplifier - specified at the -3dB point - as a function of input frequency. Remember that BW ratings are at the input to the amplifier and that your PROBES

might also attenuate your signals.

Remember that -3dB is down in amplitude by almost 30%. You probably don't want a 30% error in your amplitude measurements. Consider the higher BW DSOs practical so your measurements are back up the BW response curve where you can be certain of accurate measurements.

Look out for DSOs that have BW ratings that reflect their best performance but only in certain voltage ranges. Make sure the actual rating matches your real requirement.

Look out for DSOs that reduce sample rates by the number of channels activated. This could cause aliasing by changing the relationship of how fast the DSO is sampling vs. the BW of the signals you are digitizing. Most DSOs today report the sample rate on screen. Pay attention to it as you change the number of active channels and/or sweep speed settings.

Many scopes have analog BW specifications far greater than their single-shot sample rates nyquist (.5 sample rate) frequency. This is so when repetitive waveforms are viewed, the maximum BW signals can be seen. BE CERTAIN YOU CAN SAMPLE FAST ENOUGH IN REAL TIME (SINGLE SHOT) MODE ON ALL CHANNELS SO AS NOT TO ALIAS!

TRIGGER
If you can't TRIGGER on the waveforms you need to see, you have a real problem! This should be center stage for your demo if you are looking at a new scope. There are various trigger capabilities and a combination of them that are easy to use that capture your waveforms is the most desirable.

Know how frequently you need to trigger. The maximum trigger rate is a key specification that isn't often published in manufacturer's specifications as there can be many variables. Evaluate and compare!

Some DSOs have a MEMORY SEGMENTATION feature that lets you trigger very rapidly and fill just a portion (1 segment out of n number of segments) per trigger.

Most DSOs will let you trigger on the width of pulses <GLITCH>, the INTERVALS between pulses, the LOGICAL or PATTERN conditions between inputs, after specific delays by events or time, drop out conditions, etc. Compare!

Look for TRIGGER ICONS that relate how the current trigger selection is working. This is very helpful if you are looking at a screen dump later and trying to reacquire with the same trigger conditions.

DSOs are valuable tools for looking at video signals but not all DSOs offer a video trigger as a standard feature. Compare!

DSOs can almost always capture single shot events but not always with the amount of pre or post trigger delay you might need. If your application requires capturing a lot of transient waveforms, look into the span of trigger delay as an important spec.

*DIGITAL SIGNAL PROCESSING <DSP>
By doing math on the waveforms, additional information can be obtained. Some

instruments really slow down when DSP is being performed. Ask for benchmark specifications on the key functions you need. Don't waste your time looking at DSOs that just aren't fast enough.

Another DSP concern is that you may wish to do a SERIES of functions. How many functions can be chained varies from model to model. Compare!

Consider these potential DSP functions:

Arithmetic (Add, Subtract, Multiply, Divide any traces)
Averaging (Get rid of random noise, improve resolution)
Enhanced Resolution (Smoothing, improves resolution at reduced BW)
Functions (Integrate, Differentiate, Envelope, etc.)
FFT (Spectral analysis of any trace)
Histograms (Distributions of measured values)
Pass/Fail Testing (Comparisons of live waveforms to masks or measurements)
Trending (Time series of measured values)

*ARCHIVAL & MEMORY
ARCHIVAL
Floppy Disks - They are nice - should be MS-DOS and should come with file formatter so you can convert to ASCII and back then back to binary. Macintosh can read MS-DOS disks so both popular platforms can be used. Make sure you can print to disk so that you can import the scope screens into your documentation.

Hard Disks - They are becoming available and offer the same kind of convenience that is realized in PCs.

Memory Cards - They are expensive but they are fast - up to 200 times faster than a floppy. Require reader at PC to use the data.

Printers/Plotters - They are the best way of showing the world your waveforms and your measurements. Plotters are great for elegant color - most impressive for overheads.

ARCHIVAL DATA FILE TYPES:
Waveform files - Binary but with conversions to ASCII for import into other programs and from ASCII to scope's binary format.

Set Up Files - Most scopes have front panel setups that you can recall and store either in nonvolatile memory in scope or to disk.

Screen Plots - "Print to disk" graphics files that are screen dump imports into your word processor.

MEMORY
Tricky! Manufactures specify their largest numbers. Look out for some DSO's acquisition memory values that divide by the number of active channels.

The acquisition memory depth on any channel x the sample rate maximum recording time at the maximum sample rate. Turning the time per division control towards longer acquisition times will slow the sample rate and change the banner specification of the DSO. This is why deep memory can be so important. Know what you need for maximum sample rate recording time and keep

a sharp eye on the sample rate as you use the instrument.

Don't confuse acquisition memory with reference memory specifications. Reference memory is used for copies of waveforms recorded earlier and made available for comparison either by viewing or by mathematics. Some scopes have longer acquisition memories than storage memory. Compare!

Not all DSOs have the same number of reference memories. More are better. Make sure they have the width to contain your processed data. You can't store 12 bit averaged waveform data in 8 bit reference memory. Compare.

Not all DSOs have the same number of memories for front panel set-up/storage and recall. Compare.

Some manufacturers offer MEMORY CARDS for additional reference memory.

Some scopes allow for MEMORY SEGMENTATION where you can acquire multiple trigger events in a single sweep display. A few models will also record the time of each trigger event that occurred.

*ADCs
ADCs - SPEED:
This is tricky. Manufactures specify their fastest ADC numbers. Lookout for SAMPLE RATE banner spec. values that divide by the number of channels that are turned on. Look out also for short record length DSOs that can only sample at maximum rates for short periods of time. Ideally, the sample rate value should be seen on screen all the time.

Check to make certain what the SAMPLE RATE speeds relate to - either REAL TIME <Single Shot> or RIS <Random Interleaved Sampling (same as EQUIVALENT TIME) rates.

REAL TIME is used for transient capture and should be > 2 times your highest frequency observed. Random Interleaved Sampling <RIS> or EQUIVALENT TIME <ET> is used for repetitive waveforms.

ADCS - RESOLUTION:
This refers to full scale resolution. An 8 bit digitizer will divide full scale input voltages by 255 counts. Thus the minimum discernible sampled value on a 1 volt full scale 8 bit scope would be 1 / 256 .00390 volts.

Some DSOs display amplitude and timing values along the interpretive line that connects the samples. This increases the resolution of your measurements and potentially the accuracy.

If you have repetitive waveforms, you can increase your vertical resolution with AVERAGING.

If you have transient waveforms, you can increase your vertical resolution by low-pass filtering each sweep <FIR> for ENHANCED RESOLUTION.

ADCS - ACCURACY:
Not all ADCs are created equally. The most common figure of merit is EFFECTIVE BITS that basically relate the number of correct bits of a given ADC's actual

measurements vs.ideal.

*DEMOS & PURCHASING
You can contact these manufacturers directly. They will send you their full-line catalog and application notes that pertain to DSOs and current pricing. ☐
The primary American manufacturers of DSOs are:

o Hewlett-Packard 800 452-4844 in Palo Alto, CA

o LeCroy Corporation 800 553-2769 in Chestnut Ridge, NY

o Tektronix Corporation 800 426-2200 in Beaverton, OR

If you live outside of the United States, you should contact each manufacturer's local sales office in your area. ☐

BEFORE THE DEMO:
Be in touch with your business needs as they relate to your DSO needs. Are you going to faster designs soon that might impact the banner specs you'll need? Is this DSO the tool for that design or some problem you have now? Future requirements might impact how long "the perfect scope" looks perfect. Will the DSO effect your ability to finish a project on time? Costs to own vs. costs to wait are good values to calculate and put in your justification. Plan right for the future.

Let your S I G N A L S determine the primary specifications of the instrument you choose.

Let your A P P L I C A T I O N determine your secondary specifications.

Make your "Wish List". Write down exactly what you expect the target DSO to do. Try to find out what the most popular DSO is for your application. Talk to some people that use it and find out what they like/dislike. See if they would buy the same model again.

Get a sense of how solid your budget is and how soon you can place an order once you make a decision. If it is more than 6 months away and your short term needs are critical, consider rental or lease.

Plan several different demos with different manufacturers. Let them know it is a "competitive situation" and you want the best DSO you can get that meets your needs. Relate that you expect to place an order within a week after all the evaluations are completed. You'll get a lot of attention and the best of services.

Schedule the demos in your lab instead of your conference room. You'll be closer to your signals and the real environment <what noise?> where the DSO will have to work. If more than one (1) person is to use the DSO, make sure the demo occurs when everyone can see it. If your group is scattered and tough to catch, try EMAIL or a poster by the coffee pot. That will shorten everyone's learning curve and produce the best questions.

You should plan to see a demo of the exact model DSO you are thinking of using - with all the options you believe you'll need - conducted by a Sales Engineer that knows the instrument and what you need it to do extremely well. Some manufacturers use distributors or reps that won't know DSO technology or applications very well. It is usually best if you can get a factory's Sales Engineer to conduct your demo and review your application.

The DSO Manufacturer's Sales Engineer should be a GREAT RESOURCE to you. By reviewing your application and assisting you with a model selection that is technically correct, your demo will be much less likely to disappoint you or anyone else.

If you have never met the Sales Engineer, plan to start with a quick tour of your facility and dove tail into why you need the DSO showing him the area that it will be used in and what you expect it to do. The Sales Engineer's tour may let him see things that will help you that you hadn't thought about.

DURING THE DEMO:
A quick overview of the DSO's banner specifications and key features is a good place to start the demo. Focus quickly on how to drive the front panel and how to extract the various functions. If it looks complex, save front panels you'll need to recall. Ask questions.

You should see your signals on screen EARLY into the demo and plan to borrow the DSO for at least a few days to evaluate it if the demo goes well.

The demo should prove that the DSO model being demoed can do your specific application(s). If the demo can't do that, you are probably wasting time by evaluating it further AFTER the demo. If the DSO has to do a specific task, see it happen at the demo and learn how to replicate the settings so you can do it after the Sales Engineer leaves. If the DSO is for general purpose use, see it doing the most difficult task you can imagine before the Sales Engineer leaves.

Pay attention to the NUMBER OF BUTTONS that have to get pushed to go from one operation to the next. If the demo is really canned, force some hopping around so you see typical vs. streamlined operation. Remember, you are supposed to do this AND engineer something. If it takes major brain power just to drive the scope, be cautious.

If this is your first demo, ask why this DSO model is a superior choice for you. Build a list of advantages that allow you to compare and make a good choice. Add these items to your Wish List of what you expect the DSO to do.

Find out how long the DSO model you are looking at has been on the market. Ask for MTBF figures <Mean Time Between Failures>. Find out where the closest service center is and how long a typical repair or calibration turnaround might take. See what their policy is for loaner units should emergency service be required.

If you are a LARGE company, find out who else in your company is using the same/similar DSO from the Sales Engineer. Chat with the other users and get their opinions after the demo but during the evaluation. They might be a good source for overcoming common measurement problems that you will have as well as a potential source for remote control software.

If you are a SMALL company, find out who else in your industry within your area is using the same/similar DSO from the Sales Engineer. Call them and get their opinions after the demo during your evaluation.

Take as much time as you like. Don't rush it. Ask questions. Record answers. Enjoy the process. If you get saturated, take a break and return.

Check the demo DSO that will be left for evaluation to make sure:
o That it will accept your full scale voltages
o That it samples fast enough to capture your waveforms with high fidelity
o That it is not affected by other signals in your environment
o That it has the options necessary to take your measurements
o That it has a manual covering operations o That you have the applications engineering telephone number for support during your evaluation period

DURING THE EVALUATION:
Make notes of the questions you have and record the answers. It will keep you focused.

Call the factory's application's group and test them to see how well they answer your questions. Get application notes sent to you that address your areas of interest and see how soon they arrive. Is there ever a telephone or service charge for contacting them?

Don't believe there is one DSO that does EVERYTHING. Most labs have a variety of scopes for various functions. Don't be discouraged if the model you are looking at doesn't do EVERYTHING. But don't accept a model that doesn't do what you need.

Try this experiment with the DSO you are considering. Connect a signal source up to the DSO where you can vary the amplitude of the signal by very small amounts. The waveform should have at least 3 or 4 complete cycles on screen and be 90% of full scale. Once you have a stable trigger, store a copy of the waveform into a reference memory. Then activate math so that all new waveforms are being subtracted from the waveform in reference memory. See how little you can change the amplitude level on the generator to see and measure the difference with the scope. Remember: A large part of the utility of a scope is verifying that things are exactly as they should be and seeing when they aren't.

AFTER THE EVALUATION:
If the DSO met your expectations perfectly and you have decided to purchase it, you might try to see if you can keep the evaluation unit until your new unit arrives.

If the DSO met your expectations and you have decided to keep evaluating, make sure you know what your likes/dislikes are for comparing with the next unit. Many people make a chart for grading and comparison. The more units you look at, the greater the chance for confusion and frustration. Stay focused on what you need!

If the DSO didn't meet your expectations, make sure you know why and include the new things you've discovered in your Wish List that you've learned.

PURCHASING
Get a list of ALL OPTIONS available for the DSO so that you can order the exact configuration that really addresses your needs. Make sure you and your Sales Engineer determine issues that might include:
o Memory Expansion Options
o Waveform Processing Options
o Disk Drive Options
o Printer Options
o Hardware Options <External clock, video trigger, I/O, iso amps, etc.>
o Active Probes
o Probes with different attenuations than those supplied with the DSO
o Scope Cart
o Rack Mount
o Hard Shell Transit Case for safe and convenient shipping your DSO to remote sites
o Probes for all channels <Not all DSOs come with a probe/channel!>

You should also explore the manufacturer's policies and costs regarding:
o Applications Assistance
o Calibrations- NIST, MIL, Performance Checks, At-Site Service
o Capabilities for Training Users
o DSO System Software/Firmware Upgrades
o Warranty Period - Extensions

You should get a written quotation that relates the model, specifications, options, all costs, delivery, and any discounts available. Most manufacturers offer Educational, GSA, Quantity, and Demo discounts if you qualify.

You might also consider rental or leasing options. Some rental companies offer equity rentals where rental/lease fees apply towards purchase.

I'm not familiar with Envoy, but if it can use SANA II drivers it should
be able to use this one. Currently my driver only supports encapsulating
higher level protocols (like IP and presumably Envoy) in AX25 Unnumbered
Information frames so it is up to the higher protocol to 'connect'.

If I misunderstood your question, or you need more information, please
let me know.

I am interested in digital utility DXing and am getting
a little frustrated searching lists just to find out how to set my KAM+ and
even the KAM+ is a little limited to what I can decode I have looked at the
InfoTech range of decoders but I beleive it is a little difficult to get it to
identify unknown signals (that is analyse and decide what mode it is listening
to).
Than I have been told of this Hoka Code 3 I beleive it
is a European product but don"t know who makes or sells or both it but I have
been told it is software based and it identifies modes and has datascope all
the u beaut bells and whistles you could possibly want here in Australia no
one knows much about it other than it does exsists so I am hoping someone out
there knows more and even better can give me details how to get one and what
they are like.
Thanks in advance

Dear hamsters,

I am just up and runing the new and greatest windows95 and Jnos1.10h
and was wondering if any body out there is doing the same thing? When
Jnos is minimized on my desktop it still runs fine but in its minimize
mode it does not hear data packets comming from the serial port (Com1
in my case) I was just wondering if anyone else is running Jnos and
win95 and having the same problem and figured this one out? If so
please send me a email and tell me how you did it (If you don't mind!)

Thanks so much for reading my post!

>the TNC at 9600 baud, and I am not using SIO, or any other COM driver.

>John.
I'm running jnos110h under warp with no problems, but I do use SIO (8port version) It runs 4 serial ports
with no overrunns or checksum errors. Don't know why you are having the problem, but maybe switching
to SIO would help.

1840. Connecting PC to a diode matrix

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-30 00:00:00 UTC
From: ppiercey@nlnet.nf.ca
Message-ID: <ppiercey.9.000E3441@nlnet.nf.ca>
Source record: 43773

I have been trying to get a JNOS box and a FBB BBS connected to a diode matrix over the past week or so. I got everything hooked up but the PCs wouldn't communicate with the node TNCs. If there is anyone who has a set up similar to this, could they please EMail me a copy of the set up files and instructions to make it work. I think there is a problem with my BPQ files and the JNOS attachment. The node, running X1J2, works fine but no connection to the PCs. I made up adapters based on the BPQ docs as well. All help would be appreciated, especially if it solves my problems HI.

Looking at the circit drawing and Kenwood notes I think you will find that the
North Anerican version uses a different pcb and does NOT have any of the
components for 800MHz, nor does it have space to fit them.

Thanks for the review, Steve. As you saw, the configurablility of KaWin
is very extensive, and the configure dialog takes a while to come up as
a result. And, I'm really sorry about the nag screens, but I really want
to keep KaWin affordable to every ham who uses a Kantronics TNC in
Windows. If only a fraction of those who use KaWin register it, they
will have to carry a much cost load. The nag screens are intended to
allow you a reasonable opportunity to evaluate the full porgram - with
nothing left out - and still discourage freeloading. I too wish there
were a "better way" and am always open to suggestions.

The color change you saw with the <tab> key is explaned in the help file under Screen/Send Window. The idea is to keep the user always aware of where keyboard input will go. I find it very frustrating to learn a command sequence, and then discover that it doesn't always work the same way. Often, that problem is caused because the part of the program that is accepting my keystrokes has changed and that command sequence is not appropriate for the new context. KaWin addresses this classic Windows app problem by 1) minimizing the number of contexts that will accept keystrokes at any given time, and 2) indicating by a text color change who has the focus at any given time. As you say, the colors are configurable and it's easy to defeat this feature. I feel it is one of the features of KaWin that contributes to operating speed under difficult conditions - ie, when trying to bust an rtty pileup for an ATNO, or contesting late on the second day.

As far as who needs KaWin or host mode... Anyone who regularly connects to more than one station at a time needs host mode. The tnc-2 protocol for tracking input and output to multiple streams requires super-human concentration for any but very occasional use, and it is simply too ambiguous for reliable software interpretation. Kam users get the full use of their dual port Kam ONLY in host mode, and anyone with more than one Kantronics TNC is in for a real treat with multiple TNC support in KaWin.

Does that means everyone should switch to KaWin? Not hardly. KaWin is a Windows app and runs best on a fast computer - like Windows. Hams with older, slower computers would do well to stick with a solid program like KaGold and DOS on their system, and of course, KaWin is only available for Kantronics TNC users. But, if you run windows on a 386DX-25 or better, and if your Kantronics TNC is doing anything but decorating a corner of your shack, you'll be a KaWin user soon enough :-)

Sorry your first impression wasn't more positive, Steve, but thanks for giving me the opportunity to hear and respond to your review. 73 de kf0ia, Igottago... Stan ..

1843. 9600 with FT212RH & G3RUH

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-30 00:00:00 UTC
From: dj1@vax1.mankato.msus.edu
Message-ID: <1995Apr30.105157@vax1.mankato.msus.edu>
Source record: 43776

Hello,
I am trying to get on 9600 baud packet with a G3RUH modem and a Yeasu 212-RH 2meter radio. My transmit is fine, but my receive is what is giving me problems. If another station overdeviates then I can receive hit and miss, but if they deviate within specs, then I cannot. The greenlight on the TNC won't or barely lights up. I used another radio for comparisons and it worked a bit better because the discriminator was louder. However, it still didn't perform as it should. I measured to output of the discriminator and it falls within the required specs of the 9600 modem.

I then started to look at the modem. If I short out the first resistor (87K) then the audio is much better. When I listen to TP4 and compare it with what is being fed, there is a noticeable drop in level at TP4. Is TP4 supposed to be louder or softer then the signal fed? IF I connect to RX and TX in a loopback, everything works just fine, however I know that the TX is a bit louder then what is normally expected from a discriminator.

On the radio I looked and there is a 3.3K resistor between the chip and the edge of the board where I attached the wire to. Did anybody have to remove this resistor?

Thanks for you thoughts and time....

1844. HELP!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-30 00:00:00 UTC
From: Joe Serocki <jserocki@wwa.com>
Message-ID: <3o0s7a$kvr@news.wwa.com>
Source record: 43777

I have a KPC-3 and Yaesu FT-230R (relay radio). It works somewhat,
but I getting really bad connects, and there are often disconnects.
The connections are OK, I have tried messing with the volume control,
I use the CD SOFTWARE setting. TXD is 50.

Any suggestions? It just is not working well enuf, unless the station
is local.

73 and thanks for any suggestions

1845. Re: Kantronics host mode now in Windows

Source record: 43778

I was very excited about this program, waiting several years for
a windows based Kantronics application, in fact I planned on
switching to a AEA unit just for this reason.

Saw you program and downloaded it immediatly and tried it out.

Running on a 486DX2/66 with 20 megs memory..

It was very slow and sluggish - I noticed that this was written
in Visual Basic - do you have debug code running and/or do you
plan to rewrite your code in C or some comercial grade code prior
to release?

1847. Connecting Newton to TNC (or ext modem)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-01 00:00:00 UTC
From: jrl2@crux1.cit.cornell.edu
Message-ID: <3o3kq6$jqh@tuba.cit.cornell.edu>
Source record: 43640
Cross-posted to: comp.sys.newton.misc,rec.radio.amateur.digital.misc

Hi,
I have a Newton 100 and would like to connect it to my KPC 3 TNC for
use in amateur radio (packet). Does anyone know of a program that would
let me do this?
I tried TermLimit but kept getting a error when I tried to connect. I had it set to serial and what I thought was the correct speed, maybe I was wrong. I'm
using the same serial cable that works with my TNC on the mac.

For the non-ham radio people a TNC is basically a external modem. I need
to be able to connect to it over the serial line and give it commands (they are not the standard hayes modem commands)

Later

Totally excellent and by far the best decoder for the serious
hobbyist. Only rivalled by the gear from WaveCom but is much
less expensive due to Hoka being software based. You'll need
a decent PC with at least 386 and 25MHz CPU. It's developed in
Holland but their UK stockists are:

Hoka Electronics (UK)
NTech Communications
8 The Crescent
Willingdon
East Sussex
BN20 9RN
UK

+44 1323 483966

Here's my feature list, part of a soon-to-be-installed decoders
overview on WWW. Hope that helps.

73, Mike

---%--- snippity snip ---%---

Decoder: Hoka Code 3 (version 4)

Level: Comprehensive, sophisticated decoder for Experts

Synopsis: The Hoka Code 3 comes in two parts: an interface box
which connects to a free serial port of an IBM
compatible PC, and the software itself, on a 1.44Mb
3.5 inch PC diskette. The decoder is implemented
entirely in software which makes it extremely
powerful together with a wealth of analysis tools,
most of which are also included as standard. This is
probably the most powerful decoder for its price.
The user has practically complete control over all
important parameters for each mode decoded. Exotic

data systems are available as optional software modules, at extra cost. Comprehensive on-screen diagnostics and system information are shown for each mode decoded. Each module is chosen from a simple menu system with one-key commands to set or change system parameters. There is even an optional module (Auto Classification) which will look at a signal and tell you what the data system is! Full Synoptic decoding of meteo AAXX and BBXX codes is also available as an option.

Modes Decoded: Baudot RTTY Auto speed determination
CW Auto speed determination
TORG-10 & 11
SITOR-A
SITOR-B
ASCII (ITA-5/IRA)
FEC-A
FEC-S
SI-FEC
SI-ARQ
AUTOSPEC
SPREAD 11, 21, 51
DUP-ARQ
TWINPLEX
ARQ-6-90 & 98
SWED-ARQ
ARQ-E
ARQ-E3
POL-ARQ
ARQ-M2
ARQ-M4
ARQ-N
PACTOR, including ICRC variants (Optional)
Hellschreiber
Piccolo Mark VI (Optional)
Coquelet Mark I & Mark II (Optional)
ROU-FEC/RUM-FEC (Optional)
HC-ARQ (Optional)
HNG-FEC (Optional)
AX.25 Packet 300 and 1200 Baud
FAX 60, 90, 120, 240 LPM: 288, 352, 576 IOC
Meteo Synoptic Decoder (Optional)

Analysis Tools: Signal Oscilloscope (Optional)
Signal Spectrum Analyser (+ Baud Rate and Speed)
Save Decoded text to Disk File (Optional)
Save Signal Bit Structure to Disk File
Signal Autocorrelation (Raw & Modulated signal)
Bitstream Autocorrelation
Speed Measurement

Mark Space Timing
Bitstream Analysis
Character Analysis (Simplex and Duplex Systems)
Auto Classification (Optional)

Extras Required: IBM Compatible PC (at least 80386 CPU)
Mono or Colour Monitor
1 free serial port (for LF3 Interface connection)

I use a Dataengine with a 1200 and a 9600 baud modem. I leave it in KISS
mode, and it stays in KISS mode. It also handles packets at least up to 512
bytes, I haven't tried anything larger yet.

As for being closed, Kantronics provides full hardware/software
documentation for developing 3rd party stuff for the Dataengine. (Now,
if somebody actually would, I haven't heard about any.)

I have been very happy with the Dataengine, though it is a bit pricey.

1852. Interfacing Mot Mitrek to TNC -- HELP!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-01 00:00:00 UTC
From: alynch@wpdis01.wpafb.af.mil
Message-ID: <9505011504.AA00451@wpdis01.wpafb.af.mil>
Source record: 43783

Are there any Motorola Mitrek Gurus out there who know how to interface the radio to a TNC?

At Hamvention, I bought a Mot Mitrek (VHF) radio for use as a dedicated packet radio. Unfortunately, the only VHF (!!) model I saw at Hamvention flea market had no documentation! The radio includes: Radio (w/key), cables (power and controls), control box (channel, on/vol, squelch), speaker, and mounting hardware.

Unfortunately, the control box is disconnected from the cable. I assume that the cable is a straight pass thru connector (ie, pin 1 on radio connects to socket 1 on the control box, etc) and will experiment with that later. Please let me know if this is incorrect!

I would like to know 2 things:

1. How can I interface to a TNC (I have a MFJ 1278, but most any TNC interface will do, as long as I can find where ground, PTT, audio in and audio out lines are)
2. How many amps from a 12v power supply does the Mot Mitrek require (total power needed)?

Thanks in advance for your help!

73 de N8VEM

Andrew Lynch

PS, I found a vendor for the crystal oscillators needed to convert the radio to the ham bands, any suggestions on other vendors would be appreciated!!

1853. Re: MFJ-1278 Software

Newsgroup: rec.radio.amateur.digital.misc

Source record: 43784

Andrew,Stay away from the Multicom software unless you are hell-bent to
waste your money on old obsolite software .I don't know when it was
written but it sure is outdated and hard to use.The stupid copy
protection setup allows you to install it only twice,it has an uninstall
program that will let you uninstall it and then reinstall however it
isn't worth the effort to install once,you get the picture.
The instructions are a hodgepodge of seperate sheets ,the program is also
the same,not 1 smooth operating system but a patchwork of seperate ones.
The only saving grace for MFJ is a program written by KF7XP Gary Johnson.
XPCOM is a top notch piece of software and it's like Prego sauce,"It's
all in there". from logging to rig control. don't take my word for it
give it a try at.
ftp://ftp.indirect.com/pub/software/hamradio/xpware/
You won't be sorry.

I'd recommend against using a radio link for at least three reasons:

- Any form of wireless communication can be intercepted,
including passwords

- The throughput will be amazingly slow

- You may not be able to find any gateways to Ethernet from where
you are, or, if you do, there may be too many hops.

I performed a search for Internet Access providers in Africa and came up
with the following:

Internet Africa
http://www.durban.iaccess.za/flyer.htm

The Internet Solution

Envoy is not able to connect to anything. Envoy is designed to use an SANA II
driver to go online. So this driver has to handle all the needet stuff.
Envoy just tells the SANA II device to go online .....

Greetings
Dieter

What you need is a specialized program such as "Amazing Kenwood V.4.0"
Hamcom and Jvfax do not work as "terminal emulators" for your Kenwood
receiver.
You can find this program in most anonymous ftp sites under the Radio

1865. Recommendations for TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-02 00:00:00 UTC
From: mulveyr@vivanet.com
Message-ID: <3o47o5$jof@vivanews.vivanet.com>
Source record: 43648

Hello:

Considering that my TNC just bit the dust, I'm looking for a replacement.
Does anyone have recommendations? I'm not overly interested in a multi-mode,
though I'd like to have 9600 + satellite functionality. I've seen ads for
the Pacomm Sprint, but don't know much about it. Suggestions?

Thanks!
- Rich

Arden,

I bought HamWindows about a year and a half ago and I was not too impressed.

Perhaps newer versions are better, but even for a Windoze application
it was very sluggish. It was written with a package called ToolBook,
not a real code development language like C or Pascal.

I don't know if the software maker is still in business, but unless
things have improved recently, I don't think you will be too happy
with HamWindows...Just my opinion...

1867. Packet domains for UK

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-02 00:00:00 UTC
From: mikech@hysteria.bri.hp.com
Message-ID: <D7yHnx.n4z@bri.hp.com>
Source record: 43650

Could someone please tell a non-packet ham the FULL packet address
for a BBS in the UK. I'm trying to use an Internet-to-Packet
gateway in the states (there are none here, AFAIK), and only the
BBS name of GB7BNM.

Tnx

Mike G0UGR

1868. PK-88 as TheNET node? Can it be done?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-02 00:00:00 UTC
From: rumbalj@govonca.gov.on.ca
Message-ID: <1995May2.151811.13463@govonca.gov.on.ca>
Source record: 43651

I have a PK-88 tnc and would like to set it up as a node on our local network. Question is, because it is not a TNC-2 compatible tnc, can it be configured to run THEnet node firmware (and eventually X1Jr4)??

If you have any comments, I'd love to hear from you, prefereably by email. Thanks for taking the time to read this message.

Ah, ok, the Data Engine is a rather different beastie, and a bit O.T.T.
(Over The Top) for a personal TNC. In this area, we use them with BPQ
software as super nodes with umpteen ports each, including a couple of 9600
ones, and they really are incredible for such a small box. The only problem
is trying the get the cases back together after an EPROM change; I always
struggle to get the rectangular LEDs to line up with the holes in the front
panel!

I digress...

That should have read BPQ *firmware* not software; it replaces the
Kantronics EPROM. Sorry for the mistake.

Thanks for your kind reply.

I have been puzzled by my lack of success with HammComm etc.
I have rewired my serial leads twice !

Having just sat the RAE I hope to be on the air before too long.

I am keen to get my Morse in shape and therefore must get a decoder working hence connecting up my R.5000.

If you would send me the afore mentioned program via Email I should be grateful.

TNX !

Regards

Giles.

>

I hve been trying the same experiment. I have been able to connect to the TNC using TermLimit and a null modem connnector. I can see the TNC startup message when I power it up, clicking MORE gets me a CMD: line. The problem is when I try to send to the TNC. Sending anything, text or carriage return, freezes up the Newton. Turning the TNC off sometimes unlocks the Newt, a reset works better. But I have not been able to talk to the TNC either.

Source record: 43660

>> I am examining the possibility of linking to the internet
via radio because i presume it will be cheaper in the long run
than linking through the telephone system there. <<

Hmm. There are a few Internet links to packet, here in the U.S.
However, I wouldn't be eager to go Web surfing over these links.
A typical Web page can be 1/4 to 1/2 megabyte in length. At 1200
baud - or even at 9600 baud - this can take a while - even
through a telephone dial up link. But over packet, where you have
to wait for airtime and for packets to be passed along the route
from node to node - you could be waiting for a very long time
before you get even just one page.

Packet into Internet works for ASCII -based email, just fine.

connect my HT to my computer for Packet radio. <<
Check with the hams in your area to see if someone has
information on the BAYCOM or BAYPAK device, that does, just as
you ask. There is a kit, for about $20, that contains a printed
circuit board and software, and most of the parts that you will
need, to build a BAYPAK. I don't know who puts the kit together,
but I will be picking one up at the meeting of my local HAM club,
tomorrow night, from a fellow ham who picked up a bunch of 'em at
a swap meet this last weekend. Even if you can get the schematic,
this kit makes it a lot easier - AND it includes the software
that WILL provide the logic that lets your PC do most of the
work.

Hi Cliff!

Dunnioi about Win95. I just tried the same thing with JNOS 110I under os/2 2.1
and the minimized process still worked just fine.

Like I said, I don't know about Win95. I havce a friend who rins JNOS under
Win3.11 and he finds that it doesn't work very well when the window is
minimized.

Is win95 a true pre-empive multitasker like Linux, Unix, os/2, VMS, RTE-A,
MVS and almost any other modern os or is it something less? -

Sorry Bob, my development system is very similar to yours and I consider KaWin to be fast! Many of the Beta Test Team for KaWin (all are full-time professional programmers and active hams) use home systems that are considerably slower than yours, and all are pleased with the speed and responsiveness of KaWin.

KaWin is employs a highly graphic user interface that benefits from accelerated screen graphics. You don't mention what your graphics card is. Could this be your problem? Try the comp.os.ms-windows.misc newsgroup for help in tuning up your system, then give KaWin another whirl.

I have no plans to rewrite KaWin in C, or anything else. After 30 years of making computers dance in many languages, I am no longer amused by language bigots of any stripe. VB is an appropriate tool for this application. If that isn't good enough for you, I'm afraid you have an even longer wait ahead of you.

In all but the most demanding graphic environments, Visual Basic is plently fast on most machines. If you have a form with a lot of buttons (an example I use is I had about 50 check boxes with text for selecting what NMEA sentences were legal), it can hesitate before drawing. Nothing affects perceived speed under Windoze more than a low-end video card. Short of upgrading from an XT, the best thing you can do for any machine running Windoze is spend money on a good video card, then a fast processor, then a fast disk, then more memory.

I noticed that this was written in Visual Basic - do you have
debug code running and/or do you plan to rewrite your code in C or
some comercial grade code prior to release?

>>>I have no plans to rewrite KaWin in C, or anything else. After
30 years of making computers dance in many languages, I am no
longer amused by language bigots of any stripe. VB is an
appropriate tool for this application.

I'm sorry you think this is bigotry - being in software marketing
myself, I just do not think it is fair to ask folks to pay $100
for software written in code not suitable for comercial release -
maybe $29.00 - it just doesn't make sense - VB is very useful for
quick up apps - but WAY WAY to fat for something like this. Any
VB app I have seen tried to be release as comercial software has
ended up being trash - major memory leaks and instability with
varied configurations.

>>>If that isn't good enough for you, I'm afraid you have an even
longer wait ahead of you.

Well, you were my last hope.

Version 2.42a of the G8NPF Personal Message System (NPFPMS) is now available as a self-exploding file 'NPF242A.EXE'. NPFPMS is designed to be used with G8BPQ node software (version 4.08 or greater) on PC-AT class (286 and higher) machines.

The PMS code is available from :

ftp.funet.fi (128.214.248.6) as /pub/ham/packet/misc/NPF242A.EXE
ftp.demon.co.uk (158.152.1.44) as /pub/ham/NPF242A.EXE

Uploaded with permission, and on behalf of, the author Ted Harrison G8NPF (tedharrison@cix.compulink.co.uk).

>
>If you want to run NOS is a multiprogramming environment: meaning that you want
>to be able to do something else useful at the same time, give os/2 2.1 or
>os/2 3.0 (warp) a try. I've been able to carry on telnet & ftp via NOS on
>one com port at the same time I had procomm talking to a LL BBS on another
>com port. Can winDoze do this?
>

NOT to start an 'OS war' here, *but* ....
Yes, 'windoze' can do this, providing it's Windows NT.
IMHO I don't think comparing Warp and Win3.1 is quite apples and apples.
Yes NT costs more, and requires more resources, but I have both
NT and Warp, and I use NT.

What I was wondering was if the author of the original post had found a
packet shim for AX.25 that would work with WINSOCK (using ? stack).
That would allow me to use WINSOCK apps I had written for 'windoze'
with amateur TCP/IP.

>ebocraze
For Web surfing, I wouldn't waste the time or bandwidth. Reason? too slow! Even at 9600 baud, your airtime would be better spent on just about anything else. For chatting or email, however, packet would be quite acceptable, as long as network loads are reasonable. Also, no real security on packet, so watch when you give out info of even the slightest sensitivity.

G'Day Charlie,

It was actually Tony 6XP who posed this to me. I dunno if it was nothing more throwing flatus into the breeze hence my query. Considering the time frame between 1.81 & 1.28, I thought it unlikely.

According to the manual, it can be done. In my manual (3/90 Rev) it devotes
an appendix to mods to make a PK-88 a NetRom/TheNet node.

Thanks, all. I've got what I need now. Matter of fact, I was given a Baypac the other night. Now all I got to do is make the cable work with my HTX-202. There's an interesting note in the instructions that has me a little confused, as I don't know the radio all that well yet. Has anyone actually wired up one of these into a HTX-202? I know I've a note from one guy (Andy?) in my files and I'm going to go hunt that down. I don't recall if that was wrt Baypac or some other modem/tnc, so I'd still appreciate hearing from anyone who has made this connection already.

Thanks & 73,

You can order a manual for your radio from Motorola Parts Dept. at (800) 422-4210.

Part numbers are:
68-81037E70 for 40/60 watt 1-4 F
68-81039E75 for 75/110 watt 1-4 F
68-81045E70 for B suffix units
68-81040E80 for Super Consolette Base

I second the success with OS/2. I have had no problems with any version
of JNOS under all versions of OS/2 since 2.0. It hears everything my
radio hears whether it is active, minimized or in the background. It
also runs smoothly with other big apps running, such as IBM Works or
Microsoft Word, thanks to OS/2's multitasking prowess.

G'day Charlie,

What sites have TPK 1.82 on them, I know that nic.funet.fi has it in the
/pub/ham/packet/terminal directory but as you will know if you can use a closer
site you get a much better t'fer rate. So where is it closer to home?. The
reason that I am looking for it is that the copy that I got via a friend of a
friend etc came with a couple of undocumented features. So I need a fresh copy.

thanks in advance,

Bob....

I have to agree with Stan... I downloaded KaWin and gave it a try ....
Although I use KaGold/DspGold from InterFlex systems fulltime .... I think
Stan has a great product... and no it is not slow ... I ran it on my 386 and
my 486 machines and was quite pleased with the results.... I do not work
terrestrial packet much any more ... now that I am on the PacSats .... but
if I did I would go with this program ... the user interface is good and

everything appears well thought out...

Stan keep up the good work ......

B.T.W. Stan--I strongly agree with your comment on language bigots...However, my agreement is only based on 15 years working in machine code, assembly, FORTRAN, COBOL, PL-1, Pascal, C, C++ and ADA.

I believe that all Navtex is broadcast on 518 kHz, and I don't know
myself, but I would expect there should be stations out there. Depending
on the radio you're using, and which sideband, you would need to select
1.9 kHz above or below 518, just like a Wefax broadcast, so try 519.9 or
516.1 kHz.

As long as the PK88 is TNC2 compatible, it will work (can't remember).

Note that if it is a real old tnc with 16K RAM and a 2 MHz clock you will need to upgrade the tnc to 4.9 MHz, the RAM to 32K and the RS232 driver op amp to make it go at 9600.

> The PK-88 is *not* TNC-2 compatible.

The PK-80 was a TNC-2 clone. Then AEA discovered that they could "do it
better". Thus the PK-87 was born. Then they discovered that they could
fix the TNC-2 matching I/O connector and they released the PK-88.

TheNet is available for TNC-2 clones only. WA8DED hostmode (not NetRom)
is available for both the TNC-2 and PK-87/88 series of TNCs.

: Life's Golden Rule: "Whoever's got the gold makes the rules."

I downloaded it and played briefly. Did it on a Mac. There are three or so
software packages out there = all can be found with a web search. Sorry,
the URLs for these are at work - I am at home now.

Essentially, each package has a proprietary software compressor
operating at about 1300 bytes/sec. I tuned into a college radio
station = sound is OK except during busy net times (east coast peak
business hours) and when complex music is sent. Curious. If it
catches on, the net could be flooded with phone calls.

Uses only some simple audio digitizer and a simple audio D to A.
I used the cheap-o stuff which comes standard in the Mac DUO 230.

Hi Luis:

There is a software package available for $49 that allows you to talk
over the Internet by using a microphone plugged into your Sound Blaster board.

If you don't have a Sound Blaster board, the company offers a board
along with software for $199.

I think that I saw an ad for this stuff in Internet World. Then again,
it may have been in BoardWatch.

Following is a copy of packet bulletin which appeared on the VK packet network yesterday. Not only is our SMA content to impose big increases in license fees on us, but they also wish to stifle experimentation.

I spoke on the phone to a Councillor of the VK6 Division of the WIA last night, & according to him, the new draft regulations (which are currently going through Federal parliament) is full of gobbledegook which makes for tough reading. Makes me wonder how those poor sods trying to get a license are going to fare. I know it's tough for them having to study for the thoery let alone having to do a law degree to understand the regs!

From: VK6UU@VK6BBS.#PER.#WA.AUS.OC
To : REGS@VKNET

NEW LICENCE CONDITIONS
MAY 1995

Having read a DRAFT copy of the new licence (new regs) conditions minus any direct reference to repeater regulations, I was disappointed to read the following....

RESTRICTIONS ON CONNECTION TO A PUBLIC TELECOMMUNICATIONS NETWORK

A Licensee must not connect an amateur station to a public telecommunications network when the licensee operates the station in:

(a) Automatic mode (including, for example, packet mode and radioteletype mode) or
(b) Computer controlled mode (including, for example, packet mode and radioteletype mode).

I take this to mean that any packet system working through a worm hole will be illegal when the new licence conditions become law. My understanding of public telecommunications network is Telecom. Private companies that operate their own ties go via Telecom in one way or another. Is my understanding correct...?

Not quite. LanLink does not support SSTV or WeFax on the MFJ-1278. I agree with staying away from the Multicom software. It is not very good especially in regards to SSTV and WeFax. Unfortunately, there does not seem to be any other software available that supports these two modes for the MFJ. Someone please correct me if I'm wrong (and tell me where I can get it).

Hi! We are currently trying to set up a LIPD Packet radio BBS
with TCP/IP networking.

Equipment Amiga3000, A2232 multi serial card connected to
3 * Amiga's, IBM 486, 2 * 14.4k modem's, TNC Tasco mirco-21 (with kiss).

Software Ami_TCP/IP 4.1, Ami_NOS, CNet BBS, AX25.device (for Ami_TCP/IP).

To date we can't get the AX25.device to config. It just keep's comming up
`no such interface'.

Any help, suggestions on help files, software, FTP site's, existing sites
running similar?

Also what file transfer protocol's are available for Packet radio?
And is there a version of NOS that supports them? Mine will only do
a UUencode/decode.

Thanks,

1925. More incredible adventures of Papo and the TNC from heck.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-05 00:00:00 UTC
From: papo@bigcat.bellcore.com
Message-ID: <3odv3i$9fs@athos.cc.bellcore.com>
Source record: 43558

Greetings:

Already Papo has spent a small fortune just to get this TNC to work.
It has bought capacitors, resistors, two cables, a 1:1 transformer, phone calls
with MFJ, a nuked RAM expansion that has forced him to buy a new Amiga
computer, I have tried every imaginable scheme to connect the 5 Din Pin
to the HTX-202, and the thing does not work :(. I already have brick
power supply and I'm about to receiver a 1/2 wave antenna for the HT.
I might not be able to use it for packet, but I'm going to finish with
a hell of a radio. :)

I have an MFJ-1274 with a Radio Shack HTX-202. I've tried all the
connection suggestions that have been given here and the
schematic given by MFJ to make it work. The end result is that the TNC
keys the transmitter, but no sound comes out. Ok, I decided to measure
the AC voltage on the resistor that is before the output DIN. Well,
there is some voltage coming accross. My last attempt would be to
connect the mic tx pin to the output mic plug and short circuit what
is supposed to be a jumper that is supposed to be there when you
are trying to connect to HT's that pull to ground when they key.

Anyway, does somebody out there has been able to connect these two things
together?

Regards,

Sorry if this is not the correct newsgroup for this
question.

Is Heathkit still in business? If they are in business, do
they still sell computer kits. At one time they sold Zenith
computers in kit form.

Is there anyone else out there selling computers in kit form
and if so how to contact them?

any comments about computer kits would be appreciated.

Thanks Art,

I really appreciate the support. And, your 15 years certainly qualifies you as an ADVANCED beginner :-)

I don't want to give Bob, or anyone else the impression that I am not open to criticism and/or suggestions for improvements to KaWin. For more than four months I have been working with the KaWin beta test team to incorporate their comments into the product and I know that I have just begun to discover what is really wanted out there. KaWin development did not stop with this initial release, and comments of what testers like AND DON'T LIKE are more than welcome.

I should point out that the members of the beta test team are all software professionals (which immediately disqualifies then from consideration as typical users :-)) and all are very active digital mode hams. Among them are some of the top rtty contesters in the country.

73 es gud dx de kf0ia, Igottago... Stan ..

J>
J> ... He who dies with the most software WINS!

Last I checked Lanlink (a good while back) it did not do the 1278 fax
and SSTV modes. Do you mean the current version will now handle fax
and SSTV? If it does, I need to revisit it! I found that the MFJ
"Multicom" software leaves much to be desired. The modem isn't bad
though.

Hi. I'm planning to use the ACB-IV card from Sealevel Systems under KA9Q NOS, under DOS. The ACB-IV is based on the 8530 SCC, and includes DMA support.

Do you know of a NOS driver for (or compatible with) this card?

Thanks,
Mitchell Tasman

Hi All,
Many thanks for reading this plea.

Can anyone advise me the makes and model numbers of DX4 or
Pentium computers that give the least (or zero, hi!) interference
on 2 metres.

(I normally use 2 cascaded GaAs FETs on front end)

Unfortunately, manufacturers change designs at the drop of a hat, so trying to go by a model number is not likely to be a sure thing. From my experience, the most likely source of interference is not the computer itself, but rather the monitor. Two suggestions:

1. Take a two meter HT with you when looking at different models.

2. If the computer is made in the US, look for a label stating compliance to class B EMI standards. You'd think class A would be the best, but not so. A is for industrial or commercial areas where more interference can be tolerated and B is for home use where interference to TVs, radios, etc is likely to be greater, so B is actually more strict.

I have a class B computer here and have no problem at all on two meters. There are some weak harmonics at several places in the HF bands, but nothing I can't live with. As I mentioned, nearly all of them are from the monitor.

Good luck.

73, Bill W7LZP

Another system that runs well is Windows NT. I have NT 3.5 running WNOS in the background and it works terrifc. I needed to write a PIF so that the WNOS session wasn't a system hog, but it otherwise runs in the background as if it were on a DOS machine of its own. I realize most don't have the system resources for Windows NT, but for those that do, it's a good route to take.

According to Martin Lynch's (Ealing, West London) latest propaganda (see ads in various magazines), his range of 'radio ready' PCs (made by Peacock) were specifically selected for their low RFI.

However, since Martin was also the guy who assured me that the Yaesu FT-5200 was a high-quality rig with a super front end and nice tx audio, I would test one very thoroughly before buying if I were you. Maybe a posting in uk.radio.amateur would help you find a Peacock PC owner.

When doing some FCC Class B testing a while back, the guys out at the
test range used Hewlett-Packard systems as the reference PCs for
'computer peripheral' testing. Their rationale was that they had measured
the lowest emissions levels on those, so they posed the least risk of
pushing a tested unit out of compliance. The FCC requires that the
peripheral pass *as a part of a system*, so system emissions can screw
you up if you're emitting on a frequency that the PC also emits on. The
additive signal can push you over the limit even though the tested
device *by itself* would pass.

For an article on HF digital comm monitoring, I'd appreciate info
on software for monitoring HF packet, PacTOR and GTOR.

I'm aware of monax25, PacketTracker, Kantronics' GMON and the MacAPRS
statistics monitoring capabilities. Ditto on what CLOVER can do.

I understand that some of the host mode programs can monitor PacTOR
and GTOR data rate changes, etc., but don't know details. Can host
mode progs do this and record such data to files?

Can readers fill me in on host mode capabilities for the HF modes?
Are there DOS or Windows progs besides monax25 and GMON that do HF
digital monitoring? Thanks, KB1JY

>Hope this helps corner the beast ! 73s de ZL2AJZ in New Zealand

Thanks for that information, Johnathan. I have looked at the Baycom WWW
pages and they are not fully completed. Before I bother the BayCom group
with personal email, I thought I would ask the net here if anyone knows who in
the U.S. is distributing Baycom 1.6. I just need the software, as I intend to
engineer my own modem for it. I have built several TNC2 9600 modems that are
30 x 40 mm and use <3 mA at 5V, so something like that should be possible with
the BayCom as well.

>Groups someplace one could download?

You can get a list from your IRC server with the /LIST command. This will show all presently active channels (groups). Channels will disappear when everyone leaves them, and anyone (including you) may start a new channel by issuing a /JOIN command with a new name (e.g. '/JOIN #newchannel'). So there really isn't a permanent list like there is on USENET. In the radio arena, #HamRadio is almost always active, and others with names that start with 'ham' may spring up from time to time. When using a radio channel, it is common practice to set your /NICK to your callsign.

>Baycomm?

These modems will operate on HF RTTY, AMTOR or packet (or any mode using a 200 Hz FSK shift) using the 300 baud (Bell 103) mode. Their 1200 baud mode is NOT compatible with the signals used for 1200 baud AFSK packet on VHF. You'll need to get the manual out and set the S registers to make the modem not generate carrier, ignore DCD, and stay on line continuously. I don't have a manual any more but I remember there was a section in the back on how to do this. After configuring the modem that way, it is ready to receive HF packet signals, using Baycom on the PC. You'll need a crossover cord that links Data Out (pin 3) on the modem to CTS (pin 5) on the PC. Inject audio from the radio into the phone line red and green wires, this is the input of a 600 ohm transformer so the signal from the LINE OUT jack on the radio should work. As long as the power stays on the modem, it will stay configured properly. The best way I can think of to generate the transmit tones (2025 and 2225 Hz) would be to use another modem, configured to transmit continuously in the answer mode (OK, that may seem like a waste, but you still have enough for 4 stations!) and similarly cable the RS-232 so DTR (pin 20) on the PC drives Data In (pin 2) of the modem. The radio should key when RTS (pin 4) on the PC goes high. My experiments only covered receiving, and it seemed to work quite well, much better than most homemade HF interfaces (Those modems were designed to work well in a time when a lot of long distance calls sounded like HF anyway).
Other software probably covers the other modes. Most homebrew projects that involve detecting the frequency of an incoming tone and converting it to a digital level can be replaced by the modem, since that is exactly what it does. Maybe they will find use for other than doorstops, if digital HF operation is your bag.

Are you asking about telemetry software or monitoring? Every host mode program that I am aware of is capable of "monitoring" all the digital modes, with the exception of G-Tor. KaWin (from me, kf0ia) in the Windows environment and KaGold (Interflex) and Hostmaster II (Kantronics) in the DOS environment all do this in host mode for the KAM and other Kantronics TNCs. What would you like to know?

Hello.

I sent e-mail to a guy asking about Packet programs for the HP48 offering to help him find them and asking him to send me any info he got. I got a reply back from him. However, I seem to have lost that message somehow, and I've gotten an FTP site for him to check out. I found a couple of terminal programs there that may do what he wants.

If you can send me another e-mail, I'll be happy to forward the ftp address to you.

Hello Everyone...

I attended the Dayton Hamvention and became seriously interested in Weather FAX,
I have one problem though, the pocketbook will not support the cost of my wants.
I do own a TNC that will handle WEFAX, but it does not come with WEFAX software,
does anyone know where I can find some Freeware/Shareware software that will handle
WEFAX. I have acquired the name of one such program (JVFAX), but cannot locate it
anywhere !!! I have two KPC-3 that I will be using as the TNC for this......

THANX IN ADVANCE !!!!

: >
: Does an LCD display cause interference also? Less so, I'd imagine.
: How about active versus passive matrix? Color versus monochrome?

I was wondering how much of a problem would remain, if one were to build
a metal enclosure, and include the LCD portable inside, open at the
front of course! Certainly LCD based equipment would be easier to do
this for than normal full sized monitors.

But even for a full sized monitor, how would a metal enclosure with
aluminum screen on front be? The screen mesh would be a pain to view
through, but it really depends on how important, how long and how much
reading is actually done from the tube while operating.

The biggest source of noise in my experience has been on the power
lines! With the equipment now all using switching power supplies, the
cheaper the equipment, the worse the noise, it seems. I had a night and
day difference swapping out the power supply in my PC, when the original
had failed. Presumably, you've already taken steps on the power line?

If the tube is color, and uses a shadow mask, IE isn't a Sony Trinitron, then its face is already effectively shielded. If the tube is monochrome, or a Trinitron, then fine wire mesh, painted flat black and and installed against the tube, will form an effective face shield, and serve as a glare filter in the bargain.

Where you have to concentrate your shielding is around the plastic case. You can either use metal, or a conductive spray. GC markets a spray that is effective.

CQ Netters...

A friend owns a PK-900 multimode TNC, he is very happy with
it's performance but he never manages to work the FAX mode ?!
From the looks of things the software supplied by the dealer
does not support or better yet does not recognize the FAX
hardware of the unit !! The software used is the same software
used by the PK-232.
When the dealer was contacted he said that the models are
more or less identical (most propably less) and the software
should not make a difference !!
Does anyone out there have the same TNC ? What software should
be used with PK-900 ? any freeware available ?

Please reply via e-mail to demetre@intranet.gr TNX

What do you want to know, Dave? 56kb packet is not difficult, and it has been used portable and mobile. The hard part is usually finding a data pump that can service the 56 kb modem at full tilt. Use of the Ottawa PI card works for ISA bus machines, but, of course, isn't of much help with the typical laptop. You can soup up a TNC2 to service the modem in 56 kb bursts, but total effective throughput is only 19.2 kb due to the limitation of having to feed the RS232 link and manage the RF side at the same time. The Kantronics Data Engine can handle it, and PacComm claims their new Sprint TNC can too.

WA4DSY has interfaced raw telco codecs to the modems and done "digital voice" while mobile. It works quite well.

Vern, there is a version of JNOS for Linux, but there is also a Linux kernel driver for AX25 that allows you to use the native TCP/IP of Linux over the radio. Unless you're wedded to JNOS for some reason, the latter method is the way to go. Your 386DX is easily up to the task, and 8 meg of RAM is adequate unless you are heavily using X windows apps. X will work in 8 meg, but performance can lag.

Give UltraPak 2.1 a try. It has multiple connects, YAPP support, scripting
and all the features you would expect from a good terminal program.
It is avaialable at ftp.demon.co.uk in the directory /pub/ham The filename
is upak21.zip.

1988. PACKET RADIO TO THE INTERNET?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-10 00:00:00 UTC
From: ja3qgi@figaro.bekkoame.or.jp
Message-ID: <3oqmgb$197@bsd386.figaro.bekkoame.or.jp>
Source record: 43621
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Hello and many thanks to everyone reading my article.

I've started `packet radio-to-the Internet' mail gateway service
on 1.2GHz FM since last March, so I would like to know how active
or popular such connectivity is now in your side.

The straightforward question is as follows:
Can you access the RBBS or gateway which handles the Internet
mail through packet radio? Are you running the system to serve
the Internet mail exchange for local packet radio users?

In this context, the term `packet radio' includes neither radio
TCP/IP nor FWD-NET. In the system of mine, the users are able to
connect to my TNC by the simplest manner in which reading and
writing mails from/to the world are processed by the easy menu-
driven user interface. The figure below illustrates the outline
of the current operation.

<FIGURE>

1989. Tell me about your mobile dual purchase..SUMMARY of responses

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-10 00:00:00 UTC
From: johns022@acpub.duke.edu
Message-ID: <johns022-1005951048260001@dsj.pdial.interpath.net>
Source record: 43622
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I was asked to repost replies to my request on advice for mobile
dual-banders; here 'tis! Thanks again to all who offered help. We still
haven't bitten -- we'll wait to buy 'em until after my wife passes her
Tech, so if you have something to say about your dual-bander, please email
me!

: have a band usage graph which sounds interesting...

: Please tell me why you bought yours, what you like and dislike about it,
: and what you'd get if you had to do it again now.

John:

Our club here at work bought such a rig to use for an emergency
communications setup (i.e., there's an earthquake, the phones are
down, and we need to call for a fire truck; (we're out in the country))

Our primary consideration was ease of use, as we'll probably not use this
radio very frequently, so we needed something we could figure out without
a manual, at least for the basic stuff.

We wound up getting an ICOM IC-2340H. It also has the attraction
of the ICOM service center in nearby Bellevue, WA.

The radios we looked at were:

Icom IC2340H, Yaesu FT-5200, Standard C5718, and Kenwood TM-733A.

We've only had the ICOM for a couple of weeks, but so far I really like it.
It's relatively easy to use, the duplicated controls for VHF and UHF make it

easy to tune and control. We are also across the street from a fairly high powered UHF pager transmitter, somewhat notorious for causing intermod problems. We haven't yet heard any intermod of significance on the ICOM from it.

A personal note on the Kenwood: playing with it in the store, I got it locked up solid, just trying to tune to a memory channel. So locked up that the salesman had to cycle power with reset depressed to unlock it! I did not find it's user interface at all intuitive.

The standard was also fairly unfriendly I thought; *All* the controls are on the microphone, and I just looked at it in confusion for a minute and put the mike down.

I did a score sheet on the radios we looked at, and here it is:

Wt Icom Std Yaesu Kenwd
3 Ease of changing bands 4 2 3 3

3 Ease of recalling and setting memories 4 1 2 1

3 Ease of direct entry of frequency (VFO) 4 2 3 3

3 PL tone stored with memory channel 4 4 4 4

2 Automatic determination of repeater 4 ? 4 ?
splits with frequency

3 Ease of going simplex 3 2 3 2

1 Back-lit keys and functions 3 2 1 4

1 Head set and mike

2 Ease of power output change. 3 3 4 4

3 General ease of control use. 3 1 3 2

1 Dual in-band recieve (listen to 2 2m 0 4 0 4
channels or 2 440M channels at once.)

1 Auto-mute of un-selected band 0 4 0 0

2 Built in diplexer 4 4 4 0

Score: 87 64 75 65

Hope this is of some use..

I just went for the Standard 5718. I really like it; especially the way that you can control the entire rig from the display mic. When parking on the street, I just put the mic under the seat with the radio and no one know's it's there (besides the antenna on the car). The expanded receive is the widest on the market and the thing is packed with features.

[3]

Hi David. I have two Yaesus mobile dual banders, an older FT-4700 and a newer FT-5200, both in current service. I choose them both for the remote mount capability of the front panel. It is the only way to get both bands neatly installed in a modern auto with a center console. It allows for a real slick installation. Both rdios have been flawless. The 4700 is mores than 4 years old. The 5200 is about 18 mos old.

I have heard that the Alinco radios are very subject to intermod interference. I can tell you that the Yaesus that I own are not immune either when in high RF areas such as NYC. Some of the dual banders need an external duplexer if you plan to use a single dual band antenna. That costs about $50. The 4700 needs one, the 5200 has it built in. There are pros and cons to both scenarios. If you wish to run an amp on only one band, the external duplexer allows you to do that in only one bands feedline. If inetersted in that, be sure to get a duplexer and antenna of suitable power. There are some dual band amps, but mostly lower power than I usually use. I prefer the Diamond line of mobile antennas.

Good luck,

Tom
K2CZ

---

[4]

I have Kenwood TM742. I bought it because I already own a Kenwood TH78A. Also, a bunch of my friends also have Kenwood; that makes it easier to learn from each other.

In general, I like the radio. There is no particular point I dislike about it. I live in L.A. Intermod is generally not a serial problem for me, may be I am not in the most series area. When I do experience intermod it is generally in the 440 MHz band.

One nice feature about TM742 is that you can add a third band, such as 220 MHz, 50 MHz, or 1.2 GHz.

Organization: Institution of Engineers, Australia

David,

I will tell you about which radio to purchase but please send me all you comments because I am also interested on what others have said.

Personally I would purchase the Yaseu FT 530. The Kenwood TH series has great audio and features however it is a bit finnicky and not very robust and Kenwood is very expensive to repair. The Icom W21A has lousy audio but a very capable rig. Good receive capabilities form about 100MHz to 900MHz.

The Alinco is also not a bad piece of gear however the current models do not seem to be put together as well as the others.

Regards,

Len Spain

Subject: Re: Tell me about your mobile dual purchase...I'm looking

David,

I'm using a Kenwood TM-731A. I've only had one problem with it that I hope is cured. If I needed another mobile rig I would consider another Kenwood. If you need a Duplexer I recommend a Larsen. If you purchase a duplexer, especially a Genisys, I would check it against it's performance specs.

If you're thinking of using DSQ encoding/decoding check to see if any repeater you might be using will pass the DTMF tones. The ones around Kansas City often do not. The repeaters I worked on decoded the DTMF,filtered it out, regenerated it cleanly to the phone lines, then kept it from being re-transmitted. Not only did this give more reliable switching, it keeps those monitoring from decoding DTMF phone numbers.

Good Hunting,
de N0USP

1991. Looking for high speed wireless data link equipment

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-10 00:00:00 UTC
From: marcoh@adelaide.DIALix.oz.au
Message-ID: <3oqbs8ngf1@adelaide.DIALix.oz.au>
Source record: 43624
Cross-posted to: rec.radio.amateur.digital.misc,aus.radio.packet,alt.radio.digital

This message is posted for a friend who is really desperate in finding a high speed wireless data link solution. He needs a working solution within 6 weeks from now.

The application is a little (moving) vehicle which is equipped with a PC in a factory environment. This vehicle requires a high speed data link while moving with another (stationary) system.

He has been looking at 9600 Bps radio modems, but these things are only half duplex and after error correction he is only left with roughly 2400 Bps (semi) full duplex. One of the limitations seems to be the bandwidth of the radios to be used with these modems. They originally claimed to be able to do higher speeds, but after asking for a written confirmation on that, they backed out of the deal with the claim that there are no radios available that have the required bandwidth to operate these high modem speeds.

He really needs twice that 4800 Bps full duplex (after error correction) as a absolute minimum, but was really looking for a 9600 Bps full duplex radio link (after error correction!).

He also looked at the 2 MBps wireless LAN systems such as the NCR WaveLAN, but according to NCR that system can not operate properly on a moving vehicle.

I suggested using two modems and using different radio frequencies, but this doubles the system price and also imposes problems with that on the vehicle there is not much room to place two antenna's (assuming one for receive and one for transmit). Also half the circuitry in the radios would not be used.

Does anybody has suggestions as to how my friend can solve his problem? He is really looking for something off-the-shelf, as there is simply not the time (remember 6 weeks!) for developing something from scratch.

Any suggestions for equipment, suppliers, amateur equipment, etc.?

Please e-mail all responses to:

marcoh@codan.com.au

I will collect the responses and forward it to my friend (by fax most likely!)

Thank you very much.

That would be great, as I liked the Gracillis stuff, but their marketing and communications skills were zero. The Gracillis BBS had the same crap on it for years at a time. oatmeal was more exciting :-)

Hi!

I am using the version of winpmail which is available on the CRIS BBS. When I first started using the mailer it would list the number of new messages along with the number of qued messages down in the lower right hand corner.

I don't know what happened, but it no longer indicates how many new messages are present. When I write a messages and que it to send out then the bottom right hand corner shows . . . 0 New, n Qued n being the number qued. The 0 shows even when there are still new messages.

I can live without this at the bottom, but I am curious why it would suddenly stop working. Is there something that I changed without realizing that I touched or changed it which caused this to happen?

Source record: 43628

I have been reading here in the background for several weeks and I think
that I am finally about to make the jump to HF packet.

I am looking for suggestions for packet software and which TNC to purchase.
My wife (soon to be working on her General ticket) and I live aboard a 35'
sailboat and are planning extended sailing. This will get us well out of
VHF range and so I am planning to use HF, HF Packet, and Marine SSB to
maintain communication.

What I am looking for is suggestions on which packet software to run, I
currently own a PowerMAC 7100, I also have the SoftPC/SoftWindows software
to allow most DOS software run correctly although it does not fully support
the 386 mode, it does a 286 emulation.

Thanks
David Zielke

: >Does anyone besides me think that this voice stuff is going to destroy
: >the Internet?
: >Jim Harvey - WB8NBS - 18538 Inkster - Redford, Mich. 48240 Amiga
: Person

: Yes there are hundreds of people on alt.irc or some such newsgroup that
: seem to think that anything they don't want to try will be the downfall
: of civilization as they know it. They will be glad to agree with and
: encourage you,

Normally I don't bite on flame bait like this, but can't pass this sarcastic response up. I'm absolutely horrified by this iphone crap, as it's dangerous on several fronts (and no I'm not from alt.irc). Rather than beat it to death, let me just throw out a couple of buzzwords to rattle around in some of the emptier heads out there. Legal? (as in let's piss the phone co's off real good, and see how long it takes to get shut down via their unfathomable tariff and trade agreements) Bandwidth? Everybody loves a free ride, so of course this thing will take off like wildfire. The backbones are pretty fat, but 99% of the net is built around T1's or less, and it only takes a handful of heavy ftp'ers to clog a T1 pipe. Can't wait to see what 100 people shoving digitized voice through one can do. Of course ds3's are nice, and when we all have one to our door, this will become a non-issue, but for now, I think we're getting ahead of the hardware. Abuse? How long will it be before some genius dreams up a real phone/iphone interface, so now we have phone servers (for local calls) all over the world? Fax versions of this have been around for some time. Now it's not just useful to those on the net, just requires the caller to have net access. 60 Minutes is gonna have a ball with this one.

: but I believe the thread is how to find the software for
: Internet Phone, and no one has answered with an address to download the
: program.

I'm going to post the ftp address, and hope those who try iphone out will see it as the loaded gun it is. Of course this thing won't 'destroy' the internet, but I'll bet good money it's going to cause plenty of grief before long.

Iphone can be obtained from ftp.vocaltec.com, dig around under /pub somewhere.

: :> I'm not familiar with Envoy, but if it can use SANA II drivers it should

Envoy 2.0 uses any conforming S2 drivers. It is a lot better than 1.65 in this respect. 1.65 would do strange things sometimes.

: :> be able to use this one. Currently my driver only supports encapsulating
: :> higher level protocols (like IP and presumably Envoy) in AX25 Unnumbered
: :> Information frames so it is up to the higher protocol to 'connect'.

I assume you mean that your driver just puts any IP packets through to the destination. If this is true, Envoy 2.0 should work well with it (unless the transmission/reply time exceeds all the internal timeouts and retries). "connect" in this case is meant on a higher level than the packet level, isn't it? If there is any "dial up before packets can be transmitted" thing that isn't done automatically, Envoy 2.0 of course can't use it as this wouldn't be within the S2 definition of a driver. S2 doesn't specify anything like this so no protocol stack would know about it. Envoy 2.0 is pretty good, but it can't do magic. ;^)

: :Envoy is not able to connect to anything. Envoy is designed to use an SANA II
: :driver to go online. So this driver has to handle all the needet stuff.
: :Envoy just tells the SANA II device to go online .....

You could put it that way.

: Well, someone with Envoy is going to have to try it I suppose, and hopefully
: let us all know.

I am not doing anything with [packet?] radio or things like that, so I obviously can't try it. I can only tell you about what Envoy 2.0 does and what it doesn't. It _does_ use any conforming S2 driver, it _doesn't_ do magic to guess special driver setup needs (which would make the driver non-conforming anyway).

I appologize if there is a more appropriate newsgroup for this, but this is the only ham-digital group I can get (so far) here. Is there a rec.radio.amateur.digital.tcpip?

=====
Has anyone out there experimented with IRC (real IRC, not converse) over TCP/IP packet radio? Just wondering how feasible it would be (is converse more efficient?). How many hams out there even have the capability to run an IRC client?

Is anyone using NNTP over TCP/IP packet?

E-mail responses are fine. (via packet too :)

: jlb

Maybe I'm missing something but, as I write this, I have my JNOS 1.10
running minimized under Windows 3.1 on a 486 DX 33. In fact, it is always
running and supports the Buckmaster CD callserver, which fires up every
now and then with no hinderance to anything else running. The JNOS is
using COM port 2 and I am using COM 3 for my modem but I can't run my
PK-232 on COM 1 when using the modem or vice versa but, other than the
IRQ conflict, I have no trouble running JNOS and other things with
Windows. Like I said, I may be missing something but... there you go, I
am not running NT.

: According to the manual, it can be done. In my manual (3/90 Rev) it devotes
: an appendix to mods to make a PK-88 a NetRom/TheNet node.

This is interesting. I was under the impression that the PK-88 wasn't
NET/ROMable but the PK-87 was. I just looked through my manual (11/90)
and found the mod. Think I'll give it a try!!!

Does anyone know how bandwidth-efficient it is? After all, it if used
CELP coding then reasonable speech would take at most 4800bits/s with
nothing at all used in the silence periods. Unfortunately I think the
DSP power needed is greater than that in the average sound card.

Message-ID: <3ornvq$3n1k@news-s01.ny.us.ibm.net>
Source record: 43492

Is anyone running the JNOS designed for the DataEngine? I would like to get a copy of your 'autoexec.nos' file. We are currently running it as a gateway between a 1200bd network and a 9600bd network.

I remember awhile back, a modification for the DataEngine to gate the received data with DCD. Does anyone have a copy they could send me? Are there any other modifications that are useful when running JNOS on a DataEngine?

Any and ALL information on the subject is welcome.

> TNCs. What would you like to know?

Thanks for comeback, Stan. Some of my question was partly answered by your earlier post. I'm interested in monitoring what you might call "protocol or modem performance." That is, how well an HF digital comm system is coping with comm conditions. With the host mode programs, I gather that one way to do this is to query the KAM, etc., with the FEND ? FEND
command often enuf to check data rate, Huffman on/off, etc., and record this to a file. (Can KaWin do that recording?)

My general question concerned software (for DOS or Windows; I have a fairly good picture of Mac monitoring software) that's *specifically* for monitoring, not just as a side benefit, as with the host mode programs.

Anybody got onfo on what kind of monitoring in this sense you can do with a PK232, in host mode or otherwise?

BTW, do you or does a Mac guru reading this know how to send the host mode FEND (ASCII 192) command character from a Mac? (It's done with ALT + keypad 192 on a PC.) Thanks to all.

While not a Windows application, the very best packet software available for the KPC-3 is KaGOLD by Interflex. There is not another package on the market that even comes close to KaGOLD.

Before you ask, I don't work for them, and I have tried all the others. Hands down, spend the money and enjoy packet communication.

For what it is worth there are a few actual windows applications available...Packet Pet for Windows is available from PacComm, and recently a new package KaWIN was introduced. Both programs are OK, but if you use KaGOLD first and then try either of the others you will be disappointed!

OK, having said that I am ready for the fiery darts to fly 8->

Another thing to look at might be the clock tick setup in windows.
Anytime that you're dealing with a Communications type program in
Windows (or any other multi-tasker), you've got to ensure that you cpu
give enough time to the background task to keep it going. Normally
Windows defaults to a foreground of 100 and a background of 50. Try

making both of the settings 100 and it may let your background task run
a little smoother.

While unable to directly answer your question, I can offer my tips about pc-rfi. I wrapped several ferrite split-cores on every wire and cable inside my machine. This reduced the noise quite a bit. Also getting a good bond between the case, power supply and motherboard. Now only some highly active graphics cause interference. My line-voltage cables also have ferrite cores and are shielded. My GASFET is mast-mounted however. Best of luck.

I'd have to say the worse offender in this area is the monitor..
even a new model MPR-II rated, energy star, etc. monitor still has a
considerable RF problem. My monitor is >6 ft from the RIG, I still get
considerable noise in the 40M band from it. It would great if I could
leave it off, but what about packet? I've gone through some basics
to help the problem, including routing power cables away from the monitor,
sourcing power from another circuit, making sure everything is grounded to the same point,
etc. Granted, the ground in my place is not top-notch -- I have
a non-ground outlet house, and run considerable line to the nearest copper
pipe.
Dunno, seems like there could be a bit less radiation from that
monitor -- 6ft meets FCC class B standard anyhow.

Almost all the computer make interference.
Here are some tips that can help to reduce the interference of a computer

1. The computer should be in a total clossed metal case
most of the computer have a plastic front or case. trough this plastic the
interference leaks out.
2. The metal case of the computer must have a good ground connection
if no ground connection is available try a radiator or make your own ground
connection
3. All grounds should be connected at ONE point (make no ground-loops)
4. Place a netfilter beteen the powernet and the power-supply-unit
most computer power supplies bring a lot of interference on the power net of
your building/group.
5. Every connection out of your computer carries interfernece out of your computer
if you have a modem it will increase the interference ot of the computer.
All devices (if possible) should be places in the computer.
Every line out of the computer works like a atenna.
6. Don't place the computer to near to your receiver/transmitter.
7. if you have different AC-groups in hour building place the computer on a other
AC-group.
8. if you have the money by a Class A product (most of the clones are Class C)
class A devices are the best.

Hopes this helps you in making a good choice for a computer.

Marco M.C.M. van heijnsbergen.

Iphone has already been covered by the media in print (a number of
magazines and newspapers) and on a couple of news programs on TV. The
idea is neat, but it's not a replacement for telephone service for
most people, and that's why it's not going to piss off the phone
company and that's why it's not going to kill the internet as we know
it. (Commercialization is going to kill the 'net as we know it -
whether that's bad or not I don't know, but I do know that Iphone is
not the real "free ride" here... If you want to really be "absolutely
horrified" there are plenty of other Internet issues to worry about.)

Iphone is only half-duplex, provides low quality speech, and requires
both parties to stay connected to the 'net in order to use it as a
telephone replacement. Sure, some folks are saving a few bucks on

their phone bills, but most people are using it as a kind of "amateur radio" replacement. No code, no theory, and talk to people from all over the world.

Regarding the real phone <-> iphone interface, it doesn't take a genius to do that, but it doesn't work very reliably either. The VOX switching method used in Iphone (remember, it's half duplex) can get hung up by junk on the phone line (like busy and re-order signals) and besides that, iphone barfs on DTMF to the point that most C.O. switches can't understand it.

There is a port for the PK-96 that uses the 8530 drivers, but
I suspect that the PK-88 is slightly different. Both do
software baud selection via the 8530 itself, but the
pk96 uses the 64180 CPU ACIA for the RS232 port and I
guess the PK-88 will use the other 8530 channel. In
fact, this would make the code a bit cleaner !

Look in the source code.

It would probably be a fairly easy job to do the port, as
most of the hard work is done by virute of the 8530 code, but
I'm not keen to do so unless there's a reasonably large
user base of PK-88s out there that people would want to press
into service.

If there is enough demand, I'll do it.

Dave

2023. KamPlus or AEA?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-12 00:00:00 UTC
From: hmm@netcom.com
Message-ID: <hmm-1205951115420001@192.0.2.1>
Source record: 43506

I am considering getting a multi-mode controller, and I want the best for the lowest price.

I am looking at so far either the Kantronics KamPlus or the AEA (I believe PKP232? not sure) - They both seem to have alot of features, and are in an OK price range - the KamPlus is $319, and the AEA is $299.

Which one is better? Or - is there another model that is better?
Ive seen the MFJ model, but I dont like MFJ because they always seem to be backordered forever...

Please help.
Thanks very much!

What would be needed is an NDIS (or ODI) AX25 driver. You could
through some intense hacking use the realmode AX25 packet driver on
the bottom, up to a NDIS shim. THe best way would be to write an AX25
encapsulation driver that conforms to the NDIS 3.1 Miniport spec.

For about $10K, I'll write you one.... :-)

Both are fine boxes. The AEA has a reputation for slightly superior
filters that a few folks think make a difference. The KAM has a lot more
flexibility with its ability to run both vhf and hf simultaneously. If you
dx on hf and monitor a dx cluster, the KAM's the only way to go.

Buy a cheap 386/40 computer and use it to run the current jnos with the DE on the KISS interface.

I tried to make the newest versions of the JNOS40 work (15 months ago) - with no success - This was before the the DCD mod was identified. I paid about $200 for my "radio computer" - I run the latest JNOS 110I on it - and can get email etc delivered to it. I use an ethernet to connect it to the main computer - which isn't on all of the time. Im a LOT happier.

Johan (wg7j) refused to release the source code for JNOS40 - even when he got married and moved to Japan. I think I saw a note from him saying that he was thinking about getting JNOS40 moving again - but I'd be surprised.

Good luck and 73's de Dave, kd6pro, kd6pro@desk.kd6pro.ampr.org.

> Baycomm?

Yes I did that, the modem was based on a AM7910 chip, I had to set it
to Bell 202 mode (if memory serves) though V23 was fine as well, but
in loopback mode so that TX/RX was done with the same set of frequencies
(1200/2400 or 1300/2100). This is typical to the half duplex packet
transmissions.
I used baycom for the sofware part. Of course. Tfpcx should do well.

Hi Scott,

Go for the AEA PK-232 it has better filters. This means you will be able to
copy better in poor signal conditions.

If you're getting RFI from your monitor, check the background pattern you're
using on the screen- the worst case rfi generating pattern is a grey background
made up from alternating black and white dots- all guns on and all guns
off, switching everything as fast as you possibly can. This is one of the
patterns
we use for rfi testing. Go for a solid color to minimise emissions from the
video portions of the display. The horizontal width link can also be a strong
magnetic radiator if it's unshielded- high currents are present.

>Almost all the computer make interference.
>Here are some tips that can help to reduce the interference of a computer
>
>1. The computer should be in a total clossed metal case
>most of the computer have a plastic front or case. trough this plastic the
>interference leaks out.

This is a good tip. All openings in the case need to be shielded. There
have to be openings for ventilation, but these should be covered with
metal mesh, similiar to the way any other RF equipment is handled. The
case seams need to be joined according to good RF practice. For VHF
suppression, that requires that the joining surfaces be paint free and
a screw should be used every 5 cm along the seam. Alternately, finger
stock can be used at seams. Removable media disk drive openings can
be a problem. Usually, the best course here is to install shielding
behind the drive bay and just suffer the interference when a floppy
is being written or read.

>2. The metal case of the computer must have a good ground connection
>if no ground connection is available try a radiator or make your own ground
>connection

This is not necesarily a good idea. Connection to Earth may or may not
improve interference suppression depending on the topology of the station
and computer installation. Frequently, connection to Earth will *worsen*
interference. You'll need to experiment with your particular layout to
see if this helps or not.

>3. All grounds should be connected at ONE point (make no ground-loops)

This is a good tip. Ground loops will insure mutual coupling of interference.

>4. Place a netfilter beteen the powernet and the power-supply-unit
>most computer power supplies bring a lot of interference on the power net of
>your building/group.

This is also a good tip. However, the filter needs to be bonded directly
to the computer chassis. Filters built into extension cords may or may not
help, and can sometimes make interference worse.

>5. Every connection out of your computer carries interfernece out of your
>computer
>if you have a modem it will increase the interference ot of the computer.
>All devices (if possible) should be places in the computer.
>Every line out of the computer works like a atenna.

This is generally true. However, use of internal modems and such can make your computer more vulnerable to lightning damage. Properly installed and connected, external modems can have as low an interference level, and offer some lightning protection by keeping the telephone line surge suppressor's return path off the computer chassis. Careful thought to Earth connections, if any, can help here. Earthing the modem rather than the computer can serve to keep surge return currents away from the more valuable computer.

>6. Don't place the computer to near to your receiver/transmitter.

Generally good advice. This will reduce cabinet to cabinet induced radiation. However, proper shielding of *both* radio and computer will allow them to be placed adjacent to each other without undue interference.

>7. if you have different AC-groups in hour building place the computer on a other
>AC-group.

This may, or may not, help. Again it is a function of total station topology. If you have any interconnections between station equipment and the computer, such as a packet modem or the like, then you want the systems on common power. Getting on another leg of the power distribution will insure ground loops in this case.

>8. if you have the money by a Class A product (most of the clones are Class C)
>class A devices are the best.

This is wrong (for the USA at least). Class A products are permitted for industrial/commercial zoning and have a higher permitted radiation limit than Class B devices which are permitted for residential zoning. I'm not aware of a Class C rating for computers in the USA (European standards may be different). There is a third rating beyond Class B, however, and that is Tempest. This is primarily for certain secure computer systems, and is *very* well RF shielded.

An additional item, and the most important in most cases, needs to be addressed. That's *monitor* radiation. For HF, and often for VHF, interference, the monitor is the primary culprit. Most of today's computer monitors have plastic cases and no, or inadequate, internal shielding. Use of metal, metal mesh, or foils to shield the cabinets will yield large interference reductions. Alternately, use of special EMI conductive sprays on the plastic cabinets will often work. For shadow masked color tubes, no additional shielding will generally be required for the monitor face. But for monochrome tubes, or Trinitron type color tubes, some sort of tube face shielding will be required. Fine wire mesh, painted flat black, can be installed over the tube face if required. This will do dual duty as an RF shield and a glare shield.

Special attention needs to be taken with the monitor cabling. The video cable will have signal components from the lowest LF to the VHF spectrum, and the power cable will normally have surge currents corresponding to the horizontal sweep rate and its harmonics. These cables need to be well shielded and properly installed to prevent

leakage. Use of ferrites on cable shields will suppress common mode radiation leakage.

The final problem is the keyboard. Most keyboards are totally unshielded, and the key scan matrix can generate considerable interference. Ordinary shielding techniques will make the keyboard unusable, so different methods have to be used. Waveshaping of the scan matrix signals, and adequate decoupling capacitor use will go far to reduce keyboard EMI. Often, however, it's simply better to try several different keyboards and pick the one with the least noise generation. I've found the Focus 2001 brand to be particularly quiet, and to have good key feel and layout, so I've standardized on that one for all my PCs. Other keyboards may meet your needs better. Mice, too, can be interference generators. Again, trying several and picking the least obnoxious is usually the best course.

Gary

I run about 60 feet between the tnc and computer for vhf work with no problems
(KAM Plus to a Mac IIfx). For HF work, I just have to be next to the radio for
fine tuning... I also have phonenet networking cabling in the shack (and in
the entire house) and don't have any problems on hf bands where my swr is
reasonable.

The RS-232 spec says 50 feet (or is it meters?), but that's not much help for a couple of reasons. Some TNCs implement their RS-232 in a non-conforming way, and RF pickup can be a hazard. The best I can do is say to keep it as short as possible, and use good shielded cabling.

I've actually gotten away with a 500 foot underground run at 9600 baud, but that's certainly far in excess of the specification. A short haul modem would have been the proper solution.

2043. Re: KamPlus or AEA?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-13 00:00:00 UTC
From: rsmith@internetmci.com
Message-ID: <3p2qno$9b@news.internetmci.com>
Source record: 43526

I have used the KAM and loved it - it works the vhf packet and all hf modes quite nicely - like an appliance! You will have no trouble with it.

I switched recently to a PK900 (about $450) from AEA for a number of reasons that you may want to consider:

Allow me to compare:

Simultaneous VHF/HF operation
KAM YES PK232 NO PK900 YES

9.6 packet speed upgrade option
KAM NO PK232 NO PK900 YES ($75.00)

Standard TAPR header for expansion (like DSP systems)
KAM NO PK232 NO PK900 YES

Comercial Windows Software
KAM NO* PK232 YES PK900 YES

If you are not interested in expansion or upgrading and just want to work VHF/HF modes out of the box the KAM is for you. KAMS seem to be a bit more proprietary, thus you do not get to use alot of the cool stuff put out by TAPR and AMSAT. But the unit is very solid.

* There is a new Windows program for KAM out - KAWIN - I tired it on a very fast machine (486DX/66, 20 meg RAM) and it ran a little slow but others have been satisfied with it.

Haai there,

I'm looking for a mailer under Windows. I want to use it with JNOS. I allready found GMAIL, but that's not exactly want I want. If it's possible I want a mailer which is checking in the background if there's new mail and than puts a flag (or whatever) at the icon. Does something like that exists? And where to get it?

Thank in advance!

Greetings from Holland,

Sjoerd Krol

E-mail : skrol@inter.nl.net

>--
> Al Butler KA0IES
> ajbutler@ia.net

The "T-1" packet modem was not the whole story. Ka7oei in Salt lake has
designed and built/tested a 1.2 meg modem designed to interface to a
micro-wave radio. For further info see the PCsig at tapr. Clint sent the data
there to avoid a bunch of questions filling up his mailbox.
It should be PCsig message 1224 or there abouts.

From: czito@nyx10.cs.du.edu
Message-ID: <3p424j$pdu@nyx10.cs.du.edu>
Source record: 43530

I'd say about 50 feet easily anything past that may take a bit of tinkering..

BTW for runs like that you will probably want to pick up a couple of DB9
or DB25 to modular 6 wire waldos as this is the cheapest/easiest way to
make the longer runs...

(If you wanted to play around a bit or get a relly long run take a look
at the serial to fiber optic kits but then you start getting into
serious $$$$)

>I and some other local hams are getting interested in 9600 bps.

Get ready for a lot of work. I'd recommend 19.2k with Kantronics radios.
Much easier. I'm running two of those radios with a DRSI DPK-2 modem
modified to bypass the internal modem chip and output 19.2k NRZI.
I tried 9600 in Oklahoma City for a few years, but it was finicky as hell.
Mostly it worked only at night when the propogation settled.

> We like to use some old commercial gear because it is easy for us to get
> and align. I am looking for any suggestions to what is the best and
> easist tranciever to get.

Get the one that's easy for you to get :-)

The best 9600 radio is the Tekk. Run it through a brick for power, as it only
has 1.5 to 2 Watts. Do not purchase the Kantronics small UHF brick though.
It is junk. I sent mine back and it broke again within minutes. It's on the
shelf for parts and hard knocks education.

>In your repies please state the mods if any that are required for the
>radio to handle the large bandwidth of 9600 bps.

The Tekk is 9600 ready. No mods. The Kantronics D4-10 is both 9600 and
19.2k ready at 12 Watts.

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

For those who don't know NET/Mac...NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that ham radio operators
can use NET/Mac for their wireless TCP/IP networking.

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

If you're on America On Line or Internet, I can send these files to you.
Just request them via EMAIL and they'll go out to you the same hour your
request is received.

Free "Macnet Roster" HyperCard Stack

"Macnet Roster" (ver. 670) has just been updated and lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster", you have 2 options:

1) Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

2) If you are on America On Line or Internet, send me EMAIL requesting the latest version and I will send it to you.

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

Frankly, yes the filters -may- be a little bit better on the PK-232 but when it comes to all around flexibility and general operating pleasure...the KAM takes the cake. It's got G-TOR on HF, which the 232 does not, and I think outweighs the filters on the PK...since most of us have either DSP or a nice passband filter in or connected to our rigs already. 73!

Bob,
I recieved your e-mail. Thanks. However I am unable to send e-mail to
you. It keeps getting bounced back by postmaster@compuserve.com. Mail
delivery failure. Refused. Postage due.

Hello Bob. I downloaded Skyrider v1.4 from the ARRL BBS the other
evening. It installed just fine and was very user friendly and got on
the air with it in very short order. Unfortunately it was not exactly
what I was looking for. Myself and many other MFJ owners have benn
looking for a long time for software that supports SSTV and maybe
WeFax for this TNC. There is none available with the exception of the
MFJ Multicom which frankly sucks when it comes to these modes to the
point of being unusable.
Any plans to include these modes or at least SSTV in future versions
of Skyrider?
Also, congratulations on writing a very fine windows application.
Very pleasant looking and very easy to use. I'm sure a lot of hams
who just got their MFJ's and are looking for software for the more
standard modes would be most interested in previewing your program.
I would be glad to upload Skyrider to several of the hamradio
software sites on the internet for you. I have an unlimited, flat
monthly rate account, so it would be no problem. However, I will
await your permission before doing this. This would allow hams on
the internet to obtain the shareware without the need for a long
distance phone call.
Thanks.
Jim
ka0mgm@netins.net

You can reply to me via e-mail if you prefer Bob. I'm recieving yours
just fine.
73's
Jim

2061. Free Apple II Packet Program

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-15 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1405952154090001@wd1v.mv.com>
Source record: 43444

ATTENTION PACKET OPERATORS WITH APPLE II COMPUTERS

The long awaited new version of the APR (Apple Packet Radio) program, V3.0, is now available! For those of you not familiar with APR, it is a terminal emulation program for Apple II series computers. In addition to normal terminal emulation functions, it has many special features for use with a TNC; short-cut commands for changing TNC operating modes, calling stations, etc. It also has a scrolled screen text buffer, supports binary file transfers and YAPP (tm) file transfer protocol. It also has a "file server" feature that (under operator control) allows other stations to connect and download files unattended.

The program can be used on the following Apple II series computers: IIgs, //e, //c and][+ (with 64K memory and upper/lower case video). On machines without a built-in modem port, a Super Serial card is required in Slot 2 for TNC communications.

For a copy of the program (and a few miscellaneous utility programs), send a blank disk -- either 5.25 in. or 3.5 in. -- (no HD disks, please!) along with a disk mailer with sufficient return postage to:

Archive-name: radio/personal-intro
Revision: 2.1 1994/11/01 03:50:23
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I am told by a fellow in Montreal, Bert, that the easiest radios to
convert are Motorola Moxies. They are cheap and easy. Just make sure
that you get the 450 Mhz models, not the UHF high band.

2064. Getting FM Digital Sideband to PC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-15 00:00:00 UTC
From: fritz@omni.voicenet.com
Message-ID: <3p7vb7$9k6@nova.voicenet.com>
Source record: 43447

I'm really hoping that someone can help me to figure out how to take a FM sideband decoder, get the signal through a modem and into my PC.

I'm trying to recieve stock and bond quotes that are transmitted on a FM sideband.

Thanks!

Fritz Egerter

Look in Radio-Electronics or Ham mags for kits. These kits output the
multiplexed information - either elevator music or data. It's not a sideband,
it's the complete audio through a 38 kHz balanced mixer and then added to
the signal. Other mixing frequencies are common also, but 38 kHz is popular
due to the 19 kHz pilot.

>I'm trying to recieve stock and bond quotes that are transmitted on a FM

The data is encrypted by the way.

Source record: 43453

It was written thus:

> Hi, I am going to be speaking at an upcoming ham meeting on APRS. I have t
>software but have never actually used it.
---
use

At least, unzip the file, and read all the docs! Then, go find somebody who used it to speak in your place!

I use APRS here. I have a GPS in my boat, and I take an old t1000 laptop out with me. I use APRS on the boat to send my position(automatically) to my home computer, where it is displayed. The XYL can glance, and see where I am. This is only one use, and although I have used it for 2 years, I wouldn't consider myself enough of an expert to speak on it before a meeting..to do so without ever using it is ridiculous!

Message-ID: <3p8chu$5a4@usenet.srv.cis.pitt.edu>
Source record: 43456

Bob,glad you asked the question I went through the same thing with my
900. First "NEVER" hook the tnc to the same power supply as the rig.
It says so in the manuel and I also found out the hard way.
Second be careful with the power cube, the 900 needs at least 1 amp to
operate correctly.If the 900 is under powered you may be able to use vhf
packet but it will not work on the hf port or will be squirrly.
The back of the book tells you about the test mode it's in appendix d-1,
you may save yourself a lot of grief by using a good 2 amp ps.
Good luck and have fun with your 900 it's a great tnc and if you haven't
tried XPDUAL give it a try you can get there from here by clicking on the
following.

Best to use one that has PIN diode switching. The one that I use for UHF
is the Mirage D-15N. With 2W in you get 18W out. I'm getting switching
times around 80ms. Plenty fast for 9600 I've found, and will last a lot
longer than relay type T/R switches.

2077. Help TCP/IP & Baycom PAR9600 Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-16 00:00:00 UTC
From: bcdlr@aol.com
Message-ID: <3paia5$313@newsbf02.news.aol.com>
Source record: 43460

I am looking at building one of the PAR9600 baud modem from Baycom, but I would like to make reasonably sure that it will work with one of the TCP/IP software systems. I have looked at NOS, and in the autoexec.nos, it is looking for a serial port hex address, will it talk to a parallel port? Or will some other pkg. talk to the parallel port, (e.g. WINOS, JNOS, etc.)? I can do a little building and a little hacking, but I'm not up to the task of writing a new driver. I'm assuming the PAR9600 will have a TSR that runs to do the TNC functions on the computer.
Whatever NOS I use will have to talk to this TSR and the parallel port. Would it be so simple as to put the hex address of the parallel port in the autoexe.nos? I am wanting to get on 440mhz, TCP/IP in my area....

The latest version is TheNet X-1J Release 4.

It is available for the TNC2 clones and the PK96.

It can be obtained from a number of sites including

oak.oakland.edu
ftp.funet.fi
ftp.ucsd.edu
and any of the ucsd mirrors

>switchable baud rates where the PK-88 switches baud rates via software.
>So, I guess you're out of luck on running X1J4 on it. Anybody know where
>to get NET/ROM from Software 2000??
>

Correct. Is news getting reposted ? Thought this appeared last week...

There are two ports of X1J4, one to the TNC2 and one to the PK96.
The source is included if anyone wants to do a port.

The 8530 drivers can be found in the PK96 version, but the PK96
version assumes a 64180 CPU and uses the built in peripherals.

Therefore what is needed is to put the 8530 drivers from the
PK96 port into the TNC2 version to create a version for the
PK88 - but I know nothing of the PK88 internals to know what
else differs from the TNC2.

I'm reluctant to do the port myself unless there's a significant
body of people need it.

I received nil responses to the offer last week, so do I conclude
there is no interest ?

Source record: 43468

I've just got a few questions about this seemingly wonderful data
controller which I would really love to get.
First of all, does the HF port only support HF modes? I have
heard that if you want to use HF packet, It has to be wired through the
VHF port...or does the HF port support _all_ the HF protocols? (PACTOR,
Packet, RTTY, etc..)
Second...how well, if at all, does the 9600 baud plug in option
work with satellites such as KITSAT?
Thanks a lot for choosing to reply...if you do that is. Also, if
you decide to, could you please include any comments, gripes, or praises
you have about it. Once again, thanks and 73!

2087. Papo and the TNC from heck IT'S ALIVE!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-17 00:00:00 UTC
From: papo@bigcat.bellcore.com
Message-ID: <3pcugq$2lr@athos.cc.bellcore.com>
Source record: 43390

Yeap.. It's alive!!!!! At last the HTX-202 and the MFJ-TNC 1274 spoke
each other. Kudos to Dean, VA3CDD. For those having problems with
the set up and that are not afraid to pick up a solder. This is
what Dean and I did: The suggestion came from MFJ.

On the TNC Diagram, look for the jumper and the resistor which
joins the PTT and the TX from the modulating chip. It will
look like this:

```
ptt --------------------+-----------> pin 3
|
|-|
jumper K/L
|-|
|
>
< R107/R140 (47KOhms)
>
|| |
tx audio-------||-------+-----------> pin 1
|| 0.33 uf
```

Then replace R107/R140 with a 2.2KOhms resistor and short the jumper (Install
a jumper or solder together).

You can either buy the MFJ TNC to ICOM/Yaesu cable from MFJ or build your
own cable by connecting:

```
TNC HTX-202
shield----| |---ground
pin 2-----|---------|---ground

pin 1-------------------mic input

pin 4-------------------speaker output
```

The MFJ TNC already has this set up but if you want to build your own, this
is ok.

Preliminary tests: I was able to connect to the local BBS which
is about 10 miles from home using the battery pack (2.5 watts).
I also was able to connect to another BBS about 50 miles from
home digipeating with the local one. Major coolness!

Thanks for all your suggestions.

G'day Mitchel,

If your card doesn't have too much wierd glue lc with it and it uses a Z8530 then you will be able to probably modify one of the other drivers in NOS. Currently there are drivers for PI cards, PAckeTwins and generic SCC cards. I'm not sure if the DRSI driver is a separate one or just the generic one.

Be careful with the glue logic of the card, I just finished writing a driver for the PT for Linux, it was that part of it that drove me mad, the SCC itself was much better 'behaved'.

:
: Is anyone using NNTP over TCP/IP packet?

Running any TCP/IP based program can be done over packet. This includes IRC, MUD, NNTP, etc... Anyone running Linux or BSD over packet has the capability to run the usual servers that you see on the Internet. Anything is feasible prividing you have decent links. Many people have problems trying to do something like run a convers link over a low speed packet link, so they ask for compression in it. The best way to fix things is to put up decent links and you'll find that just about anything runs very well on it, including IRC if you like or running an NNTP server. Compression such as LZW in NOS is a kludge that has been preventing people from fixing the real problem. The TCP/IP programs all work just fine over packet, even on a low speed 9600 or 19200 link (I know you're not running 1200 baud :-)

I have an IRC client on several machines here, but I never bothered to link it into the Internet IRC since I don't care for the content of the language over the regular IRC. I have thought about just setting up a server to play with though for amateur purposes and not link it into the Internet IRC.

On the NNTP stuff, lots of people are doing that. I used to run an NNTP server a couple years ago. Mostly hams just dump packet bulletins or Internet mailing lists on them and use servers locally for the users to receive the messages. There is a local one here for the Detroit area TCP/IP users on netnews.n8oej.ampr.org that gets a lot of use.

Love it but is does take about 1.5 amps to run - if you try to
hook it up to your rig's supply it will hum like nothing else -
need another powersupply - kind of chincy that AEA doesn't
include one, especially since the above - fir te price we pay.

GREATEST THING I HAVE EVER BOUGHT!!! - Just Wish I could have
afforded the DSP2232 - if you have the means I would recommend
that one!

2098. Re: KamPlus or AEA?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-17 00:00:00 UTC
From: sundiver@ix.netcom.com
Message-ID: <3pd1s6$f45@ixnews3.ix.netcom.com>
Source record: 43480

I have a Kam Plus and have never found anything to complain about it. I thought I would make one remark on the software. I am a MARS member and do a lot of Amtor traffic handling, and I use KaGold software. Most MARS members in this area (Texas) use a PK232 and PC Packratt. They quite often run into problems with using this software, this or that feature doesn't work like it's supposed to according to the manual, etc. The text capture and editing functions in KaGold are very good and never gives me any problems, it comes in very handy in traffic handling. So whichever way you go, get Gold software. KaGold for the Kam, PkGold for the 232. (Also, you get to play with G-tor with the Kam).

No, it can't be done. You have to upgrade to a KPC9612 or one of the
TNC's with a G3RUH modem. The KPC9612 limits you to an upper limit
of 9600 bps whereas the TNC's with a G3RUH modem have an upper limit
of around 56-64k bps. My experience has shown that the KPC-9612 does
not decode as well on weak signals as the G3RUH modem. (After I switched
to the KPC9612, I noticed that I can no longer decode the weaker stations
on the frequency.)

2101. Need help with HAMCOM 3.0

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-17 00:00:00 UTC
From: greg@core.rose.hp.com
Message-ID: <D8qn7r.E5p@icon.rose.hp.com>
Source record: 43483

What am I doing wrong??

I got a copy of HAMCOM 3.0 and loaded it on my 486sx-20. It seems to work, but I am having a lot of trouble getting anything intelligent out of it. I am using the opamp interface, which works just fine with JVFAX 7.0.

For CW the frequency control is extremely touchy. +/- a few 10's of Hz will make a big difference in whether it copies anything at all. Even so, it gets at best 1 out of 3 letters right. For a source I used the CW portion of one of the WeFAX broadcasts, at something like 20wpm.

AMTOR seems to get a few characters here and there, with lots of greyed out squares (errors?). Nothing readable.

I have yet to copy anything readable on RTTY, trying all of the baud rates, inverted/normal, etc. Maybe they aren't running RTTY, but none of the other modes did any better.

After the wonderful experience trying JVFAX and seeing all those full color pictures being beamed across the country, this is a bit disappointing. Anybody know what I'm doing wrong?

Thanks,

Greg KO6TH

A world of difference! The KAM is the all-mode thing, whereas the
KPC 2400 is just a 1200/2400 TNC. If you have a recent manual, you'll
find it covers all models.

I'm not sure about what he has tried but the modems I have will run full
duplex. All you need is a separate transmitter and receiver, on different
freqs. It isn't that hard to set up and, depending upon the budget
available, he could even get 56kbps or more, as long as the radios could
handle it. A moving station may pose a little bit of trouble but I'm sure
it can be done. There's lots of guys doing work on high speed stuff and
I'm sure they'll give you a lot more info than I could.

>Hello
>Could someone please tell me of a site where I could download the latest
>version of TheNet X? from by ftp

>Thanks
>Stu

The Net X1J version 4, is in 5 parts at this site.
The oddball named file is hotncold.zip which is the docs for the thermal sensor
option. The rest have X1J4 in their file names. Be sure to unzip the parts
into separate directories as there are files with the same names between them.

FTP: ftp.ucsd.edu
directory: hamradio/packet/tcpip/incomming

The single ZIP file that has all 5 parts is about 1.25 meg. but I don't think
it is at ucsd now.

I'm about to take AEA on their attractive offer of $75.00 for a 9.6K G3RUH modem that came in the box of the PK900 I bought last weekend John.

Do you know if this is a G3RUH clone or more proprietary like the Kantronics versions.

>you do it and how much would it cost.

Victor, you jack up the KPC-3, and drive a KPC-9612 under it. :-(
One of the drawbacks of the closed Kantronics architecture is
lack of upgrade paths. There's a technical reason as well in
this case having to do with how the KPC-3 does HDLC conversion.

The KPC-3 is a great little 1200 baud TNC, and the KPC-9612 is
a good 1200/9600 TNC, but they aren't built to be upgraded the
way the TNC-2 design (commercially available today from PacComm
and MFJ) is. It's better to consider them disposable boxes in
the same way you would an old 1200 baud telco modem.

Hi All,

My local sysop has a bit of a problem with getting an internal Modem going using FBB Bios and FBB ?

It works fine using an External modem, no problems whatsoever, However when intalising FBB with this internal modem , it reports something about no handshaking.

No amount of tweeking in port.sys etc, will en-tice this beast to do it's thing..

Has anybody anywhere had any sucsses getting Internal modems to work ? (i.e. dare I say, is it a bug ??)

comments/suggestions please. ???

OK ... Here goes !

If you're running JNOS, here are the relevant attach lines:

```
# This is the normal attach line for straight kiss to com 1
# 9600 baud computer <> TNC
# Port called tnc0 is the only one
# attach asy 3f8 4 ax25 tnc0 2048 256 9600

# KPC 9612 : tnc0 is the 1200 port, tnc1 the 9K6 port

# Following two for polled kiss
# attach asy 3f8 4 pkiss tnc0 2048 256 9600
# attach kiss p0 1 tnc1

# Following two for non-polled kiss
attach asy 3f8 4 ax25 tnc0 2048 256 9600
attach kiss tnc0 1 tnc1
```

Cheers,

Gareth.

A friend fought with this for weeks. Take a look in your CMOS setup and
make sure you system is running fast/turbo and not slow.

Surprisingly, he had his running slow and once he changed it back to fast
the Hamcom worked at least an order of magnitude better.

Give it a go and tell us what happens.

2120. res2m495.zip - Imports text files for FBB, TPK, TSTHOST

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-18 00:00:00 UTC
From: rbroglio@varano.ing.unico.it
Message-ID: <9505180453.kp15484@SimTel.Coast.NET>
Source record: 43403
Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

ftp://oak.oakland.edu/SimTel/msdos/packet/res2m495.zip

SimTel/msdos/packet/
res2m495.zip Imports text files for FBB, TPK, TSTHOST

RES-TO-MSG v4.95 Copy text files in MAIL.IN (or similar) import file to
be forwarded to the SysOp of the system (FBB, TPk, TSTHOST). Files like
ERROR.SYS and *.RES (for FBB use), LOGDIST.TPK and 7PRESU and more and
more can now be easily checked by using res2msg.

You can send this files to one or more SysOps, choose English or Italian
language, choose if report should be in one message only or every text
file should have its own message, choose sender (RESMSG, SYSTEM, SYSOP),
choose if you want to delete every file that has been imported or not.
Read documentation for more informations about the program.

Special requirements: None

Changes: Automatic detection of Tsthost use (default file is TSTHOST.IN)
A number of bug fixes were made from v2.95 edition.
Corrected english translation and documentation.

res2m495.zip has replaced res2m295.zip.

Free use for Radio Amateurs. Uploaded by the author.

>I'm really hoping that someone can help me to figure out how to take a FM
>sideband decoder, get the signal through a modem and into my PC.
>
>I'm trying to recieve stock and bond quotes that are transmitted on a FM
>sideband.

The term you are looking for is *subcarrier*. The data is FM modulated on a supersonic subcarrier, somewhere in the 50-100 kHz range, likely around 67 kHz. There are subcarrier demodulator kits available that connect to the demodulator in your FM receiver (before the supersonics are rolled off in the audio amplifiers). Ramsey makes one, and there are commercial decoder boxes with RS-232 output.

Now the problem is that the stock quote data is *encrypted*. If you can't figure out how to decrypt it, you still won't have anything usable. The encryption algorithm used is pretty robust since they're trying to *sell* this service and want to make it hard on pirates trying to grab the data for free. The boxes the service providers lease to their customers usually do the decryption in firmware.

Source record: 43408

Now that I'm online, AmiCom is working, 1/2 wave antenna arrived, new
cable arrived, the HTX working without Err2 using the power supply.. yes...
life is good...

FYI

I got the South Hill Datacom catalog and it has a "new affordable,
cableless data transfer". They are basically used to transmit data from the
serial port to printers or scanners. They operate on the 900Mhz region
(923.05 - 926.95 Host and 905.05-908.95 remote unit). Data rates from
1200bps to 38.4Kbps. It uses a db-9 female rs-232 serial. The ad
claims that they have a range of 1/3 mile point to point.

Cute little interesting things to toy around, but they are way too expensive.
475.00 the kit of 2 transceivers and 500.00 bucks with the PC software.
if they were cheaper, it would be interesting to see if you could do
fast packet with these little critters (with a power amp...)

Anyway, '73

Hi,

As an active ham and member of Amateur Radio emergency Services, I work a lot of public service events, severe weather watches and emergency events. To make using an HT during these events, which can last all day, a little easier, I'd like to have a custom earphone made. This would be the type that is used by television reporters that are molded to the wearer's ear and have a coiled cord running down to the HT.

If you know of any companies that do this sort of custom molding, please post a reply here or send mail. I'd appreciate any referalls that can be offered.

73,
Erich Berman

I have this working ... using an ethernet link from the windows
machine (a P5-90) to a junker AT which runs JNOS.

The AT talks to the windows applications across the ethernet using
tcp/ip, and talks to the AX.25 BBS machine (a 386) across the
same ethernet using the G8BPQ switch ethernet backend.

Works just fine: Mosaic or Netscape running on the Windows machine
can access the ham radio network using the AT as an ip router.

You could, of course, hang the radios directly on the AT as well,
but it does not have enough horsepower to do the job I want done,
and neither does the 386, so I split the functions across two machines.

With junker 8 bit ethernet cards going for zero to ten bucks, this
makes a very cost effective solution.

For TCP/IP beginners, I strongly reccommend the NOSIntro, Into to KA9Q NOS
which is available from TAPR. Call Dorothy at 817-383-0000
There is also the KA9Q version of NOS which helps greatly when using the book.
Some-one correct me if I am wrong, but that should be the JNOS110i (version i)
which is distributed in source code, but earlier versions are executible.

The IP co-ordinator for PHX Az, according to the TAPR PSR summer 94 is
WB7TPY, David Dodell, and the begining address is 44.124.xx.xx.

Contact N7MRP, Dan, who is a BBS Sysop in PHX and should be able to
answer most of your local Q's. He is also Director of the Az Net Intertie
Group. 912.5671.

73 de Shawn, N7XBM.

Message-ID: <1995May19.165126.5906@hounix.org>
Source record: 43427

First I am looking for the docs to WG7J NOS. I found a site in Germany, but every thime I trie and get a copy, I get somekind of error and the ftp quits. Is there a site here in hte USA that has the docs or can someone email me a copy.
Second, how much memory does WG7J NOS take up and can BM use a editor and still have room for a big email. Everytime I use BM with a editor, after a few lines, it crashs. If I limit the msg to 5 or less lines, it works OK. I suppect it is running out of memory. Also, is there any way to WG7J to use extended memory, to free up local memory?? Can WG7J run under DeskVue or under a DOS window in OS/2 Warp??

Wolfgang (and others),
Skyrider is now available via anonymous ftp to:

ftp.oak.oakland.edu/pub/hamradio/digital/utils
Filename is skyv1_4b.zip

This is a Windows shareware communications program for the MFJ-1278
and 1278b tnc. Supports all modes (I think) with the exception of SSTV
and WeFax :(

IMHO, it won't. Even if NOS talked to a parallel port, that would not be sufficient (TFPCX can talk to a parallel port, but can't run the PAR96)

> I'm assuming the PAR9600 will have a TSR that runs to do the TNC >functions on the computer.

Yes, certainly. Some drivers exist, for PC/Flexnet systems, so i think some others will come soon.

Try to use JNOS or WNOS, TCP/IP softvare for AX.25. You will then get full connectivity and control over situation. It's better if you can install Linux and
get linux for hams packet. Although, recent version of JNOS can be compiled
in Linux: there is makefile. If you need more info about addresses, please mail me.

Maestro.

: I am using JNOS 10h with a Kantronics 9612 TNC (1200 and 9600 dual
: simultaneous radio ports). So far I have only used it with the 1200
: port active, but I now have a 9600 baud setup almost ready, but I am
: not sure how to setup "attach" the dual radios through the single
: serial line. Extracts from an autoexec.nos file would be appreciated.
: Thanks in advance.

According to the online help here is how you would do it.

Attach your asy port first:
attach asy 03f8 4 ax25 port1 512 256 9600
Attach to Com1 at 9600bps as you would for a standard TNC.

Attach the access to the second port of the TNC:
attach kiss port1 1 port2
This sets up what the tnc knows as port 1 to be the port2 for NOS. From what I understand the VHF or low baud port is always the KISS port 0 on most TNCs

>
>Has anybody anywhere had any sucsses getting Internal modems to work ?
>(i.e. dare I say, is it a bug ??)

I am running FBB with an internal Hayes Accura modem and using
FBBIOS. Everything works fine. There is a bug in FBB or FBBIOS that
has to do with detecting NO DIALTONE and BUSY, and does not work all
the time but I do not have the problem you mentioned. Has to be one of
the modem settings. Make sure all the RTS and CTS stuff is on, and
that you have the correct extensions after the entry in autoexec.bat or
wherever you are loading it from. I load it high from autoexec.bat
instead of appel.bat.

Make sure the COM port and IRQ's are correct also. I know this is your
basic stuff, but it has to be something simple since mine works fine.

Does the internal modem work using a standard terminal program?

2161. Which 9600 mod for TS-790A?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-20 00:00:00 UTC
From: Keith.Fritzinger@bbs.mhv.net
Message-ID: <3pleti$o58@over.mhv.net>
Source record: 43439

The Amsat ftp siite shows two 9600 mods for the Kenwood TS-790A;
The first injects TX audio at D81; the 2nd uses the J31 connector.
Anyone have experience with either mod? Thanks!

Keith.Fritzinger@bbs.mhv.net

From: elly <elly@gate.net>
Message-ID: <3pmmkj$1gso@news.gate.net>
Source record: 43346

The best UHF 9k6 radio we've found is the Azden pcs-9600d. Its genuinely plug and play, and we're forwarding to a half dozen BBS clients up to 50 miles from our HUB site. We have Tekks and Kantronics radios in the network , and they are ok...but there's just NOTHING like the Azden. Its expensive...and its only headed up with the dollar-yen business. We've been told the price will go up once the US distributor runs out of the first shipment.
So far, nothing seems to work in the way of fm mobiles on 9k6 vhf. All mode rigs seem to be ok, but so far we are dead in the water on vhf. I've heard the mfj data radio might work, but I've also heard complaints about drifting and low output. Anyone have better experience?

Source record: 43347

I have created a web page to demonstrate in an intuitive way what error control coding can do in a weak-signal environment. It includes several audio files containing simulated CW and PSK signals in noise at various S/N ratios. One of the signals, a coded PSK signal at 10bps, is so weak as to be completely inaudible to the ear, yet it can still be decoded.

The audio files are in 64kb/s mu-law format, the most popular audio file format on the web.

The page is

>>world) is about to fade away. What will they do to the amateur bands when
>>there are no amateurs left? Maybe that's what they are hoping for?
>
>Do you mean to say that new operators in Australia are only interested
>in packet? Why not introduce them to the dozen or so other modes?

Perhaps it's because people now coming to amateur radio expect to be
able to use modern communications methods. It's much like asking
shooters to use muzzleloaders instead of modern rifles for target
competitions or hunting. Some do, for the nostalgia, but most quite
properly expect to be able to use the best methods.

>CW and SSB do a great job for worldwide comunication.

Hmm, is that why everyone but fossilized amateurs are abandoning
CW? If it does such a great job, then why are the commercial and
military worlds abandoning it as quickly as possible for newer
digital methods? When everyone is out of step but you, it becomes
time to question your own pace.

Gary

S T R A W B E R R Y M A N T R A R E C O R D S

To get zines distributed, Email us at the Email address below with a sample article and a description of the zine, or maybe even the whole zine, so we can make sure we want to distribute it, and if we say kuul, then send us some copies of the zine and yr in the catalog.
To get yr tapes distributed-Be good, and have nice sound quality. Send a good-sounding master tape and a master cover we can make black and white copies from to the address at the bottom. If you don't send a master cover, we'll just make one. Don't expect great artwork. John's taking drawing class.
We'll see what he can do. At least send a song list. The more you rock, the better. No Extreme-Hole Hearted Mr. Big shlock rock, please. We don't want Country or Offspring or Contemporary or R & B or Reggae or Rap tapes. So don't send them to us. If we don't like them, we put them away. Have any or all (?) of the following elements in yr music: rock, catchy rock, punk, or hardcore. Don't be lame, and, like we said, have nice sound quality.

Our royalty policy is real simple: When we distribute you, for each copy of the album you sell through us, (whether it's on vinyl or tape or cd) you get a dollar. Our royalty policy on zines is simple, too. You keep 70% of the money, we keep 30% of the money. If we (as in you and us) decide yr zine will be two dollars, we keep 60 cents for each sold zine. (60 cents just about covers postage costs. the zine department is really non-profit) The remaining $1.40 is yours! Because of this policy, we don't buy wholesale copies of zines in advance. mainly cos it's risky to us and yr zine gets more money this way.

*Online Zines: Don't wanna wait for snail mail to bring the zine to you?
Kuul! We'll Email it to you. Just send the money to the label address telling what zine you want and where we Email the zine to so you can download

it-and
the zine will be yours within seconds of receiving the money via a
download
file. Available when the catalog specifies "Online Version." Some zines
are
available Online only, some only by mail, some both. The royalty policies
for
Online Zines remain the same. (yes, postage costs don't exist when you
send
online zines, but really, it's not fair to the non-online zines. Some of
those zines have pictures and stuff, especially art/comic-type zines,
which
would be way impossible to do online. They don't have the advantage of not
paying for copying costs and postage. Just cos they have pix doesn't mean
they should lose money.)

SoundClips from Strawberry Mantra Records. Download 20-45 second long
samples as Wave Files from Strawberry Mantra releases.

Email the screen name below to request a SoundClip. I M P O R T A N
T!!!-Must
have a sound card to play these things. If you need help, after getting yr
clip, email me, i'll do what i can. Realize that mucho sound quality has
to
be sacrificed to make SoundClips possible, and that SoundClips do not at
ALL
represent the sound quality of Strawberry Mantra releases. If AOL said
"Welcome" when you signed on, then you probably, (unless yr sound runs
through that internal PC speaker that the modem noise comes through) can
play
these things.

All prices include tax and shipping and handling.

If you run a little label yrself, contact us. We'll trade tapes and
stuff.
We make sure the sound quality is nice on our releases. And, to smaller
bands, four-track recordings are just fine. There's a lot you can do with
four track recordings to make them sound really nice. We focus on the
music.
That's why we give the bands the extra money, to bring out new material.
It's
really money out of our pockets. But we're nice. We just want to make sure
we
don't make ourselves look bad by releasing poor-quality recordings. That's
all we ask. So talk to us! See ya later.
From John Mulhausen and Andrew Bales-Owners

Email SbryMantra@aol.com
Send zines, tapes and orders (cheks payable to John Mulhausen) to:
Strawberry Mantra Records
P.O. Box 701805

Tulsa, OK 74170-1805

COMING SOON
about 20 new albums are scheduled to be sent to us
The Video- a VHS tape w/ atticus finch, john, and others live. sketches, and
behind the scenes looks at kitty vamp and strawberry mantra records. probably
will cost 7 bux
Psychedelicatessen- Strawberry Mantra is putting together a compilation that
will be sent to 14 eager radio stations. (scary) and will include at least one
song from every band we distribute. (cept the ones on the kitty vamp
compilation, of course) and if yr on the label yr on the comp. and it's going
to 12 radio stations who happen to be rather interested in us. scary....
zines galore. zines zines zines
tell me right now if you want to be updated. we're gonna bring out good
stuff, but give us a second, the label is as of now, about 2 weeks old.

Well, being a third party in the line....

yes I have hassled the man about conflicts and IRQ's etc etc

Works fine with an ordianary term prog.

The only thought I had was that perhaps the rs232 are not asserted in
the correct state for FBB bios. so it gets grumpy !!

So, a quick tweek in setting up the rs232 levels may well sort it. I
will have to wait to see what matey says via our next qso.

ta, for your suggestions Jim..

Because they don't have an interest in weak signal operations. They are
free to match their power levels to their signal path losses.

Are you *sure* you didn't know that?

To avoid messing up this fairly well-behave newsgroup, followup set.

Only because they have to train operators to use CW. Almost any idiot
can use a keyboard and push buttons (just browse round Usenet for proof
of this... :-)) but an awful lot of technology (= expensive) is needed
to make it that simple. Think of the complexity of a simple QRP CW rig.

Anyway, anyone wanting a code/nocode war please QSY to r.r.a.policy.

From: (unknown)
Message-ID: <1995May22.124644.10309@nntp.brisnet.org.au>
Source record: 43364

Thanks for reading this posting,

I have been trying to run TST Host ver 1.41 using the tfpcx 2.10 packet driver/tnc emulator.

If I start the program with the following batch file

```
@echo on
tncded 1
tfpcx286 -pcom1-f
tsthost /t /i253
tncded -u
tfpcx286 u
@echo off
```

The program starts I can connect to the BBS but it takes yonks!!

A local ham vk4itm gets the program running well with just the following batch file;

```
@echo on
tfpcx286 -pcom1
tsthost /t /i253
tfpcx286 u
@echo off
```

If I do not load tncded, tsthost will not even entertain the idea of connecting to the bbs.

Please can you help out if you have had similar probs, or you know the answer.

You can Email me at mfdwyer@ozlinkbbs.ozlink.brisnet.org.au or just follow up this posting, or I am at VK4AFM@VK4WIA.BNE.QLD.AUS.OC .

I can get TPK ver 1.82 working no probs :-)

very 73,

Michael F. Dwyer

Greg:

!. Did you read the documentation?
2. CW you set the rcvr filter on narrow and then select the tuning
menu and adj the bar to center the audio on the bar shown.
3. For Rtty try CFH Halifax when the sta is sending 850/75bd rtty
on the same freq they use for Fax, they alternate.
4. For Amtor/Sitor try the marine bands filter on narrow for any of
the WCC/WLO/WON/KPH sta's. you have to tune to a idleing/active
freq to clean up at best.
5. The HAMCOM, will work, abet poorly cause it doesn't have a filter
ckt in the audip stage before the tomes are converted in the interface.
The Best decoder would be a purpose built with filter ckts.

Hope this helps.

>Baycomm?

Are these Bell 202 or 212 modems? 1200 baud packet is Bell 202
mode. I'm willing to bet the modems you have are 212 mode.

From: wsalden@Direct.CA
Message-ID: <3pqld7$ipe@stud.Direct.CA>
Source record: 43369

Hello, I've been using my Baycom modem for quite awhile now and I love it.
I normally use the Baycom software, but I've also used GP and SP and TPK.
I keep seeing references to EMBAYCOM which I believe is an emulator which
allows one to use a simple comparator input.(I use this with Hamcom already.)

So, does EMBAYCOM exist? If so, where can I get it?

If this is a stale, or well worn question I apologise... I'm new here.

Thanks. de VE7WRS, -walter

From: dimple@leland.Stanford.EDU
Message-ID: <3pr1p2$cv8@elaine32.Stanford.EDU>
Source record: 43375

hi, there! i am currently working on a project with other stanford students
regarding music and the internet. i was hoping that someone "out there"
might be able to answer the following questions...
* How do radio stations acquire their libraries?
(I understand that they work with the radio promotions division at
recording companies, but does this relationship stand for obtaining
old as well as new music? In other words, how does a radio start from
scratch and acquire a decent sized music library? Do radio stations
of all genres acquire their music the same way?)
* Do or can music sources provide pre-digitized music?
* Do pre-made lists exist concerning how much of what kind of music
to buy when buying a large number of titles?
* Does a cataloguing system exist for sale?
* How does a radio station pay royalties and to whom?

thank you for your time.
sincerely,
ardith ibanez

Try ftp://ftp.ucsd.edu for documentation. I don't remember exactly
what's there, but you'll probably find what you need.

I've run several successive versions of JNOS in DOS sessions under OS/2
with absolutely no problems. With OS/2's multitasking prowess, you can
minimize it and not even know it's running; it won't slow down your
system.

From: i.a.cameron@open.ac.uk
Message-ID: <3ppn4p$4if@clyde.open.ac.uk>
Source record: 43378

In article <3pbd2g$1ea@news.xs4all.nl>, philippe@dds.nl (Philip Menke) says:
>
>[snip - regarding IRC on PR]
>
>In the same vein: I wonder if there are possibilities for MUDding or MOOing
>via PR? And if so with which client?
>

I tried running Circle Mud on my Linux box, and it seemed to work okay.
A friend telneted in, the mud was on TCP port 4000. The link was over
NetRom though, so we gave up in the end because it was so slow ! I was
running Wampes at the time, and used TCPGATE 4000 in the configuration.
It would probably have been quite good with a number of users, but I
was (still am) only using one port and so user access would be rather
limited. Ideal for a multiport hub though !

Cheers and 73, Ian G0TLB.

you wrote:

B> I am looking at building one of the PAR9600 baud modem from Baycom,
B> but I would like to make reasonably sure that it will work with one of
B> the TCP/IP software systems.

I think olny Baycom 1.6 is supporting the new PAR96 modem. I never heard about an other program which supports the new baycom modem. The autor of tfpcx should actually try to support the par96, but that is not for a tcp/ip software and rewriting the old ax25drv is also not possible, because the par96 is using a different system.

I am an engineer at TV station KOLR-10, a CBS affiliate in Springfield, MO. We send all our on-air folks down to the local Beltone hearing aid store, and have the pieces made. They use a clear plastic tube about 8 inches long which hangs down the back and snaps into a standard Telex magnetic earpiece. The Telex unit is similar to the ones that you might use with a transistor radio. The over the ear hook and the part that insert into the ear come off, and attach to the tube. E-mail me if you need to know where to buy the Telex units.

Dave,

The TAPR 9600 baud modem has a bit regenerator on board. Here in Seattle
we have 4 packet repeaters full duplex frequency (600 KHz offset and 5 Megs offset)
that use the TAPR 9600 board attached to a TNC-2 clone. Works very well. The local
packet repeaters work just like a normal voice repeater and the 2 meter one is only
20 KHz from a voice system with no ill effects on either system. Voice is not able
to pass thru a packet repeater and you can not kerchunk it either.

Gary

2206. A 900 MHz bandwidth totally digital receiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-23 00:00:00 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.665.004FF5DC@mail.mei.com>
Source record: 43383

On page 136 of the May 1995 issue of "Microwaves and RF" magazine, you'll find an interesting IC for those with very deep pockets (Department Of Defense).

The $590.00 (in quantities of 100!) Analog to Digital Convertor chip, part number SPT7760, from Signal Processing Technologies, Colorado Springs, boasts a sample rate if 1 GHz. That's right, a "guaranteed minimum rate" of 1 billion samples per second with 8-bit digital words.

The day when you practically connect your antenna to software is getting closer.

Say hello to a totally digital radio that can receive any form of modulation between 0 and 900 MHz entirely via software implemented in DSP chips. Not that this will be cheap or be seen in amateur radio equipment in the near future, but digital RF technology continues to blast ahead.

Could some kind soul give my a reference to the above topic. I have all the RF and modem components. What I am looking for is the latest info for this configuration (particularly cct diag if the interface required).

I do have the CNC volumes 1-11 (minus #9). The topic is mentioned, but a great deal of the techo info is not supplied.

I have TEKK radios, G3RUH 9600 (Pacomm), and Tiny-2.

What is missing is the regen side with an interface to use the TNC in a stack.

Pointers to the source of this info, or the info itself is what I am looking for.

dave

Would you like this graffitti problem in your neighborhood? The inner cities look like Hell, because no one cares. These commercial cd-rom folks will stop advertizing in our Amateur Radio Magazines and post here for Free. Do you want all the nuts and bolts magazine ads in our news groups? Hunderds of those little ads every week over and over. Then no more ham magazines...

Many good points, Bob. But i can skip over those, and i can often tell in advance of seeing by the large number of likely-to-be flaming replies attached to it. <GRIN> I can go to their WWW site if i choose to, and who knows; they might even do something cliever like include some useful things there which could encourage one to order the whole thing. What has me much more worred is junk e-mail, things that appear, unsolicited, in our e-mail (which many of us have to pay for) from these kinds of operations, simply because we posted here. Getting alot more of those really is going to be a problem.

Almost as bad as the SALE@ALLUS on amateur packet. Does anyone really read all that junk? Oh Sure! go eat a cookie.

<MUNCH> Yeah, and it won't be quite so bad if there was enough bandwidth to support it, and clever news readers. But if you get someone who hasn't connected to their packet BBS in a week or so, and merely goes to list the summary lines of everything they haven't read since then, that alone can practically saturate the pathetic 1200 bps channels that most people use in the S.F. Bay Area. It's both a bandwidth problem nationally, and in many cases locally, aggravated by junk-box human interfaces. <SIGH> [Sorry, folks, i guess i've just had a hard day]

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

> Running a spare computer in the shack for NOS - want a system
> that will run in 450K of memory - GRINOS and NOS110i and NOS110h
> both won't start but work fine on my oter computers. Any ideas?

I compiled a JN108DFF version for a guy that runs NOS on a laptop 286
640K with only a floppy drive.

He has a 80K ramdisk, an ax25 packet driver and no loading of DOS outside
the low memory. I guess this means it runs in about 500K but we've never
measured it.

If you'd like a copy, drop me a note and I'll arrange it for you on the
gateway I use.

>Don't you have to sample at twice the input frequency, i.e. 500 MHz max
>input??

Yes, that's what Nyquist says if you need to "totally" represent
all of the digitized analog signal. But that's just the RF carrier,
NOT the data of interest. The data modulating the carrier is not
that high. So just "downconvert" it and feed it in. No big deal.

They state a MINIMUM sampling rate of 1 GHz (so can it do 2 GHz??)
and a bandwidth of 900 MHz. I have not given them a call. I have
no ideas of what the price of a sigle chip would be. Probably
out of my price range. I've got fast DSP chips and development
tools laying around, so I could handle the digital side of it and
play around there (if I had the time).

From: rtdelan@aol.com
Message-ID: <3pven8$d7v@newsbf02.news.aol.com>
Source record: 43258

I am currently running JNOS 1.10j in a DOS Window in OS/2 and it runs fine, but would really like to operate something compiled for OS/2. I am familiar with compiling JNOS with Borland's C++ 3.1 and have the PMMNOS stuff that came with the QRZ callbook CD, but unsure as to what they used to compile that version.

Anyone currently having success in running an OS/2 version of NOS?

Any assistance would be appreciated.

Hi , Salut

I buy the dsp-2232 for my satellites station, and I need some informations.

The dsp-2232 will be connected to a Icom-765 hf and a Yaesu FT-736-R.

For the Icom, my 765 as 100mv rms input, and 100-300 mv rms output, so it
is ok for the input, but for the output, it look like I will be short of
output for weak signal, and cw. Also I would like to have a threshold
adjustement for cw.
Did you designe a circuit to boost the signal from the Icom 765?

The Yaesu, for the data pin in/out jack, the input is 30mv rms at 600 ohm,
and output is 200 mv rms at 10 kohm, it is looking ok for the data jack for
1200 afsk.

But I would like to use the rig for 1200 and 9600 bauds, and in the
modifications for 9600 from G3RUH, I need 800mv p,p of output from the dsp,
and I do not have the output from the discriminator.
Also, it's look like I need differrents adjustement for 1200 and 9600 bauds.
How can I use the direct discriminator and varactor connection of the Yaesu,
to run both 1200 and 9600 without playing with the adjustement of the dsp?

I know there is someone there who have the same setup, and solve the problems
I badly need plans for a interface to connect my radios to the dsp-2232, I
already try with AEA, and they never answer to my specifique question, or
send me plans, they only suggest to play around the r203 and r206 for
more transmit audio, without more infos.

Thank you.

>input??

Classically, you do, however there is another way. If you are interested
in the modulation of the signal, rather than the spectrum around the
signal, then you can sample at a rate at least 2X the *modulation*
rate, and on the frequency of the signal of interest. This effectively
aliases the signal down to baseband where a more mundane DSP can then
process the samples and recover the intelligence. So the A/D converter
needs only be capable of working at the frequency of interest, and
sampling at a much lower rate corresponding to the modulation. This
is obviously most useful where there is no adjacent channel interference.

I don't run the OS/2 JNOS code because I require LAN support and OS/2 JNOS doesn't have it. I have compiled OS/2 JNOS and played with it some. It required IBM C-Set/2 C compiler. You should be able to find a compiled version on ftp.ucsd.edu that will run on OS/2 Warp or OS/2 2.1. I don't know how stable it is or how up-to-date it is though.

S T R A W B E R R Y M A N T R A R E C O R D S

To get zines distributed, Email us at the Email address below with a sample article and a description of the zine, or maybe even the whole zine, so we can make sure we want to distribute it, and if we say kuul, then send us some copies of the zine and yr in the catalog. To get yr tapes distributed-Be good, and have nice sound quality. Send a good-sounding master tape and a master cover we can make black and white copies from to the address at the bottom. If you don't send a master cover, we'll just make one. Don't expect great artwork. John's taking drawing class. We'll see what he can do. At least send a song list. The more you rock, the better. No Extreme-Hole Hearted Mr. Big shlock rock, please. We don't want Country or Offspring or Contemporary or R & B or Reggae or Rap tapes. So don't send them to us. If we don't like them, we put them away. Have any or all (?) of the following elements in yr music: rock, catchy rock, punk, or hardcore. Don't be lame, and, like we said, have nice sound quality.

Our royalty policy is real simple: When we distribute you, for each copy of the album you sell through us, (whether it's on vinyl or tape or cd) you get a dollar. Our royalty policy on zines is simple, too. You keep 70% of the money, we keep 30% of the money. If we (as in you and us) decide yr zine will be two dollars, we keep 60 cents for each sold zine. (60 cents just about covers postage costs. the zine department is really non-profit) The remaining $1.40 is yours! Because of this policy, we don't buy wholesale copies of zines in advance. mainly cos it's risky to us and yr zine gets more money

this way.

*Online Zines: Don't wanna wait for snail mail to bring the zine to
you?
Kuul! We'll Email it to you. Just send the money to the label address
telling
what zine you want and where we Email the zine to so you can download
it-and
the zine will be yours within seconds of receiving the money via a
download
file. Available when the catalog specifies "Online Version." Some zines
are
available Online only, some only by mail, some both. The royalty policies
for
Online Zines remain the same. (yes, postage costs don't exist when you
send
online zines, but really, it's not fair to the non-online zines. Some of
those zines have pictures and stuff, especially art/comic-type zines,
which
would be way impossible to do online. They don't have the advantage of not
paying for copying costs and postage. Just cos they have pix doesn't mean
they should lose money.)

SoundClips from Strawberry Mantra Records. Download 20-45 second long
samples as Wave Files from Strawberry Mantra releases.

Email the screen name below to request a SoundClip. I M P O R T A N
T!!!-Must
have a sound card to play these things. If you need help, after getting yr
clip, email me, i'll do what i can. Realize that mucho sound quality has
to
be sacrificed to make SoundClips possible, and that SoundClips do not at
ALL
represent the sound quality of Strawberry Mantra releases. If AOL said
"Welcome" when you signed on, then you probably, (unless yr sound runs
through that internal PC speaker that the modem noise comes through) can
play
these things.

All prices include tax and shipping and handling.

If you run a little label yrself, contact us. We'll trade tapes and
stuff.
We make sure the sound quality is nice on our releases. And, to smaller
bands, four-track recordings are just fine. There's a lot you can do with
four track recordings to make them sound really nice. We focus on the
music.
That's why we give the bands the extra money, to bring out new material.
It's
really money out of our pockets. But we're nice. We just want to make sure
we
don't make ourselves look bad by releasing poor-quality recordings. That's

all we ask. So talk to us! See ya later.
From John Mulhausen and Andrew Bales-Owners

Email SbryMantra@aol.com
Send zines, tapes and orders (cheks payable to John Mulhausen) to:
Strawberry Mantra Records
P.O. Box 701805
Tulsa, OK 74170-1805

COMING SOON
about 20 new albums are scheduled to be sent to us
The Video- a VHS tape w/ atticus finch, john, and others live. sketches, and
behind the scenes looks at kitty vamp and strawberry mantra records. probably
will cost 7 bux
Psychedelicatessen- Strawberry Mantra is putting together a compilation that
will be sent to 14 eager radio stations. (scary) and will include at least one
song from every band we distribute. (cept the ones on the kitty vamp
compilation, of course) and if yr on the label yr on the comp. and it's going
to 12 radio stations who happen to be rather interested in us. scary....
zines galore. zines zines zines
tell me right now if you want to be updated. we're gonna bring out good
stuff, but give us a second, the label is as of now, about 2 weeks old.

I compiled a JN108DFF version for a guy that runs NOS on a laptop 286
640K with only a floppy drive.

He has a 80K ramdisk, an ax25 packet driver and no loading of DOS outside
the low memory. I guess this means it runs in about 500K but we've never
measured it.

If you'd like a copy, drop me a note and I'll arrange it for you on the
gateway I use.

From: Matthew Pontefract <ug_mp@ucsd.edu>
Subject: WEFAX - does anyone have an interest?

YEah - I've jsut started using JVFAX 5 (so if anyone can tell me of where
I might find version 7 UI'd be grateful) and it works very well. I'm using
a dead simple OP-AMP comparator interface plugged into an ICF 2001D at one
end and a slow 386 pc on the other. Good results but I could do with a good
frequency list with details of protocols used etc. as guessing is not always
easy!

Any advice or comments to share would be most gratefully received.

Regards,

Matthew

Dear Group Members,

Since 1992, I have been trying to locate and acquire all of the missing radio equipment for the radio restoration aboard HMCS Haida, a World War 2 Tribal class destroyer berthed in Toronto. I'm now in the home stretch with only a few pieces left to locate. Some of the rare gear has been easy to find and vice versa. The piece that has been most difficult to locate has been the Model FSC107 frequency shift converter.

There were ten's of thousands of these made for Teletype wire service in the 1950's, and I find it hard to believe that very last one has gone to the boneyard. This device operates on an 850 Hz tone shift and thousands of amateurs got their start in RTTY using one of these.

If anyone knows whereabouts of a FSC107, I would certainly appreciate hearing from you.

2242. How to get PK232mbx into KISS reliably for TCP/IP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-24 00:00:00 UTC
From: okstein@primenet.com
Message-ID: <okstein.65.0038BA83@primenet.com>
Source record: 43276

Last year I was using JNOS successfully, but something's changed! I can no longer access my TNC reliably from ver 1.10h. I suspect the problem may be in how I get the TNC into KISS mode.

I want to use TCP/IP at 9600 baud and have been using my pk232mbx with an outboard PacComm NB96 external modem.

I've been using PcPackratt for Windows. I first put the TNC into PA mode at 1200. Then I put it into 9600 speed. Then I switch to Dumb Terminal Mode and type KISS 1.Of course, when this happends, there is no way to "check" to see if it really is in Kiss mode. Then I exit Windows and try to bring up JNOS. In Trace mode, I don't see incoming packets and when I try to PING or TELNET, the PTT light never comes on the NB96 modem.

Interestingly, I can connect to several stations at 9600 baud with the same setup if I use PcPackratt rather than JNOS.

Is there a RELIABLE way to get the TNC into KISS mode from DOS or to verify it is in that mode?

Thanks.....from Frustrated in Fenix. KG7JD

17 th Anniversary of Amateur Packet Radio
May 31,1995

By: Burt Lang VE2BMQ

At around 9pm on May 31, 1978 the first transmissions of packet over Amateur Radio were sent. The place was the upstairs banquet hall of Bill Wong's Restaurent on Decarie Blvd. in Montreal, Quebec, Canada. The event was a special meeting of the Montreal Amateur Radio Club (MARC) called to discuss and debate proposed changes to the Canadian amateur frequency allocations that were being contemplated by the Dept. of Communications. In attendance were several DOC officials from Ottawa, including the Director General - Regulations, Dr. John deMercado. Dr. deMercado is considered by some to be the "father" of amateur packet radio due to his persistant pressure to open up an exclusive portion of amateur band to experiment with the new mode and due to his early experience on the Aloha project in Hawaii. Others take a less charitable view of his role in the matter.

The first packet message was reported to have been "From John deMercado to the Montreal group - Bravo, well done!" or something like that. As is common with many historical events, the participants did not bother to record the particulars and memory now is less than perfect.

The Montreal Packet Net group consisted of:

Bob Rouleau VE2PY
Norm Pearl, VE2BQS
Fred Basserman, VE2BQF
Bram Frank, VE2BFH
Jacques Orsali, VE2EPH
Ted Baleshta VE3CAF
Ian Hodgson, VE2BEN
and others not mentioned.

A detailed description of the Montreal Protocol and hardware used in the experiments is given in the TAB book #1345 "PACKET RADIO" by Bob Rouleau and Ian Hodgson published in 1981. An interesting note is that the Montreal Modem design used the Exar XR-2206/2211 chip set. I am told that a sample of the Montreal

Modem was sent to the Vancouver group (VADCG) in the fall of 1978 and it is probably no coincidence that the same chip set appeared in the TAPR TNC modem of which Doug Lockhart of VADCG had a hand in designing.

It is ironic that none of the original Montreal Packet Net group are presently in Amateur Packet Radio. After an initial spurt of activity in amateur packet, Bob Rouleau and several others in the group turned to commercial applications for packet. The resulting company, DataRadio Inc, today is building and marketing commercial packet radio systems around the world. A recent application is the Canadian Weather Radio packet service introduced several years ago using DataRadio 9600 bps equipment.

We should congratulate these early pioneers in amateur packet radio for the work they did in getting the hobby started. It is through their early efforts that today's worldwide packet system has grown, often chaotic, seldom planned but with a continuous forward progress due to the efforts of countless others in the intervening years to advance and refine the technology. In the words of the first packet message:
BRAVO, WELL DONE!!!!!!!!

****

This article is exerpted from the "MTL/WQC Packet Network User's Resource Manual" published by Burt, VE2BMQ.

---

It's time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communication Conference.

The ARRL Digital Communication Conference is an international forum for radio amateurs in digital communication, networking and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communication Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communication Conference will be held on Sep 8-10, 1995, in Arlington, Texas; minutes from Dallas/Ft Worth International Airport, in the middle of the country, and airfares have never been cheaper for this conveniently located conference.

Not only is the Digital Communication Conference technically stimulating, it's a weekend of fun for all who have more than a casual interest in any of the ham digital communication modes. This includes PBBS operators, networkers, DX PacketCluster SysOps, software writers, modem designers and digital satellite communication enthusiasts. The Digital Communication Conference is for all levels of digital operators--a "must" conference to attend to get active on a national level. Now more than ever, Amateur Radio needs this great meeting of the minds because it's important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communication Conference is one of the ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communication Conference?

* A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.
* Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communication Service) technology on Sunday.
* A Texas-sized banquet with a special guest speaker.
* Special Interest Groups (SIGs) on Saturday following the banquet.
* Informal get-togethers throughout the weekend.
* A facility perfect for this type of meeting.
* Vendor area and informal engineering discussions.

* Scores of nearby restaurants and entertainment (Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf).
* An event at which the most important new developments in amateur digital communication are announced.
* Digital "movers and shakers" from all over the world in attendance.
* Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast-growing new digital aspect of amateur operations that combines computers, packet radio and Global Positioning Satellites (GPS). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communication Systems and their applications and use in the Amateur Radio service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communication Technology (handheld and small business wireless systems) can be used in the amateur service.

The 1995 Digital Communication Conference is cohosted by Tucson Amateur Packet Radio (TAPR) and the Texas Packet Radio Society (TPRS). TAPR has been active as an international amateur research and development organization since 1981 and was responsible for development of the TNC-2 and other amateur kits and publications. TAPR has more than 2500 members worldwide. TAPR continues to provide leadership in digital amateur radio activities by supporting Special Interest Groups, conferences/meetings, publications, and research and development projects. TPRS has been active as an organization since 1984 and has been responsible for the development of the TexNet network in Texas, Oklahoma, Arkansas and Missouri. TPRS membership now tops 500 members.

Anyone interested in digital communication is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communication, tell them about this! Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL HQ, 225 Main St, Newington, CT 06111, or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

If you've attended a Digital Communication Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you've never been, make plans now to attend and find out how much fun the Digital Communication Conference can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital Amateur Radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this and more, for an unforgettable weekend of ham radio and digital

communication. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communication Conference on Sep 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E Tanque Verde Rd, Tucson, AZ 85749-9399; 817-383-0000, fax 817-566-2544; Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD, President, Tucson Amateur Packet Radio
Dave Wolf, WO5H, President, Texas Packet Radio Society

If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings and workshops will be held at the La Quinta Inn and Conference Center, 825 N Watson Rd, Arlington, TX; 800-531-5900, 817-640-4142, fax 817-649-7864, intersection of I-30 and TX 360. Rooms rates are $53/single, $58/double, $63/triple and $85+ for suites. When making reservations with the hotel, indicate that you're attending the conference. Six Flags (larger than Disneyland), the Texas Rangers and other attractions are within a few miles of the hotel. If you plan to stay at the hotel, it's highly recommended that you book your room prior to August 25, 1995--a block of 100 rooms is reserved for Friday and Saturday. The hotel provides transportation to and from D/FW International Airport. Contact the hotel to
arrange airport transportation.

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to preregister or for additional meeting information. MasterCard and VISA accepted.

Digital Communications Conference
==========
- Preregistration (before August 21) $30 *
- Late Registration or at door $35 *
* - Conference Registration includes:
Conference Proceedings, Sessions, Meetings, and Lunch.

- Saturday Evening Dinner $17 **
** - Dinner, Speaker, Prize Drawing (Limited Space)

Workshops
==========
APRS Workshop, Friday, 4-7 PM, conducted by Keith Sproul, WU2Z

- Preregistration (before August 21) $10
- Late Registration or at door $15

PCS Workshop, Sunday, 9 AM-1 PM, Dewayne Hendricks, WA8DZP
Survey of Personal Communication Systems (PCS) Technologies and their application and use in the Amateur Radio service

- Preregistration (before August 21) $10
- Late Registration or at door $15

Contact TAPR to register for the DCC.
Tucson Amateur Packet Radio, 8987-309 E Tanque Verde Rd, Tucson, AZ 85749-9399; 817-383-0000, fax 8170-566-2544.

>the channel throughput.

There is a considerable bit of work on Level 2 protocols being
done on HF (where channel conditions are typically worst). The
most notable are PACTOR I and II, Kantronics' GTOR, and HAL's
Clover. The later contains elements of both the Level 2 protocol
and an adaptive Level 1 layer.

KA9Q published papers on a demand access scheme (DAMA) that would be
suitable to VHF/UHF networks, and on a FEC scheme as well for use in
areas with pulse interference. A few amateurs have played with token
ring protocols too, but the problems of dealing with frequently dropped
tokens seem to make this a less popular approach.

Most amateurs appear to have been concentrating on the Level 1 hardware
and just playing AX25 over it.

Undersampling will work, as long as all the other alias frequencies
(including the "natural" frequency as well) are filtered out before the
converter. For example, a 60 MHz signal undersampled at 100 MHz will appear
to be a 40 MHz signal to the succeeding digital processor, so any actual 40
MHz signals must be removed in the front end. Carrying it even further, a 960
MHz signal sampled at 100 MHz should also appear to be 40 MHz. But as long as
the sampling rate is at least twice the modulation bandwidth, the information
in the signal can be recovered. The carrier, being a known quantity, does not
need to be sampled exactly.

The real problem with a receive like this one is likely to be dynamic range.
Even a 16-bit converter has a dynamic range of only 96 dB. The high-speed
converters are generally a lot less than 16 bits, maybe 6 or 8. Using a 16 bit
converter, the desired signal has to be less than 96 db below the RMS sum of
all the other signals presented to the converter (not certain to happen if the

antenna is connected directly and receives a 900 MHz bandwidth) before it can be received. It appears that even high-dollar radios will still need at least a few analog filters.

High-speed A/D converters have been in the front ends of digital oscilloscopes for quite a while now, although the rest of the scope was not equipped to do much with the signal other than store and display it, and possibly FFT it or something off-line. Digital reception may be implemented in some HF receivers, although probably not in this form. It appears to me that the conventional DDS carrier generator feeding an analog mixer could be replaced with a DDS sending a digital output into a digital mixer, then the digital products processed by a conventional DSP. This probably costs more than the analog mixer method, though.

Just a note to those interested in Facsimile and Amateur Slow Scan TV
The followin is a "quick & dirty" list of sites that have the
JVFAX version 7 program available for anonymous FTP download.

CompuServe Hamnet Froum Software/Pictures library section
NOTE: Also get WEFAX.FAQ from same section it's a better scehmatic and parts list and info packet)

FTP Sites:

FTP.UNL-KLDE in /pub0/ham-radio/jvfax70

SUN.RZ.TU-CLAUSTHAL.DE in /pub/ham-radio/ibm/fax

FAUI43.INFORMATIK.UNI-ERLANGEN.DE in /mounts/gonzo/pds/freeware/hamradio/fax_rtty

NOTE: I could be spelling incorrectly, if so the connection maybe refused.

try an "ARCHIE" search using 'prog jvfax' as the search string if needbe.

Hope this is of interest.

You may not get much of a boost from running an OS/2-specific
compilation of JNOS, unless you go in and reprogram it for multithreaded
operation. As it is, you might be just as well off running it as a
single-threaded DOS session.

Of course, there may be more technical concerns that I don't know about.

I just downloaded "TOP" (The Other Packet) program from a site somewhere (can't remember where hi...). This is a German program that has some similarity to eSkay Packet (SP). It has enough similarity so that I was able to get it up and running...but I *know* I'm missing many of the subtle features of the software, since I DON'T READ GERMAN...and all the docs are in German!

If you have English docs...or even a partial translation...or can just give me some tips...I'd like to hear from you.

2255. Mod to allow IC-38A xmt 219MHz?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-25 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goD93yAE.1tp@netcom.com>
Source record: 43289

The Icom IC-38A covers 215-230 MHz on receive and 220-225 MHz on transmit. For initial path tests in the new point-to-point fixed digital message forwarding system 219-220 MHz band, it would be useful to be able to transmit using an IC-38A between 219 and 220 MHz.

Neither ICOM America or ARTSI, publisher of Radio/Tech Modifications, has any information on such a modification.

Any information which could be used to disable the transmit inhibit to allow transmission between 219 and 220 MHz would be most appreciated. Perhaps someone in Japan who reads this message has a friend who knows the firmware in the IC-38A? My guess is that a diode matrix must be changed (a diode snipped or a diode installed) and then the micro-processor must be reset, but I'm not going to experiment!

It's not nearly as simple as it seems. I work in this field and live
a state of continual amazement about how many professionals don't
understand the dynamic range limits of A/D conversion.

First a few basics... Each bit of an A/D converter provides about 6 dB
of dynamic range. An 8 bit A/D has 256 levels. A simple way to think
of this follows...The error for approximating a signal into 256 steps
corresponds to 1/256 of the signal. 100 to 1 in voltage means 10,000
to 1 in power or 40 dB...another 2:1 gets to 200:1 corresponding to 46
dB. You can see how 256:1 yields about 48 dB.

You might recognize that 48 dB dynamic range from weakest signal to
strongest signal falls about 20-30 dB short of commonly available ham
band receivers. My experience leads me to recommend about 14 bits for
a communication receiver...meaning about 84 dB dynamic range. State
of the art today allows you to buy a 14 bit A/D at about 10 MHz sample
rate.

Now we have to look at another nasty factor that create even more need
for dynamic range...multiple signals in the passband. We can figure
out how much dynamic range the A/D needs by looking at all the sources
of signals that consume dynamic range.

First, the intended signal has to have 30-50 dB range to sound good.

Second, let's assume the digital signal processing that follows the A/D implements the final filtering and demodulation of the signal. The DSP needs enough information from the A/D to process both a strong adjacent signal and a weak intended signal at the same time. The A/D needs additional dynamic range proportional to the difference in signal strenghs. For example, with an 14 bit, 84 dB A/D, the receiver could handle a intended signal with 40 dB dynamic range plus an interfering signal 44 dB stronger.

Now consider the case where the IF passband has much wider bandwidth than the intended signal. The A/D will see many interfering signals, all potentially stronger than the intended signal. Start by assuming that the whole IF band has wall to wall strong signals...the receiver dynamic range needs to increase 40 dB for the first signal and an additional 3 dB for each doubling of the IF bandwidth after that.

A 1 GHz A/D can support and IF bandwidth of 400 MHz for a typical digital receiver 400 MHz can support 2000 channels on 20 kHz centers. 2000 channels corresponds to about 11 doublings of the IF bandwidth, thus adding 33 dB to the dynamic range requirement.

Summing up the dynamic range requirement of a hypothetical 1 GHz A/D...

40 dB for intended signals
40 dB for interfering signals
33 dB for lots of interfering signals

This totals to 113 dB, thus requiring a 19 bit A/D. I don't know if such a beast exists at any bandwidth.

This whole disucssion boils down to the need for filters to get rid of as many interfering signals as possible. For the forseeable future, the IF bandwidth will have to limit the number interfering signals by having little more bandwidth than the intended signal. Therefore, the design of ham receivers will not change significantly in the RF, mixer, IF, filters any time soon.

However. a cheap 14 bit A/D running at 100 kHz can support a 30 kHz IF bandwidth. When combined with simple and cheap DSP chips, one can build a truely marvelous HF SSB receiver.

So, you might ask why any one would need a 1 GHz A/D. The answer is that
some signals have a 400 MHz bandwidth
(synthetic aperture radars and spread sppectrum)
some receivers can assume extra IF bandwidth isn't filled with strong interfering signals

Hope this helps...

jeff, wa1hco

There is a new web page on this topic at:

http://www.sp.nps.navy.mil:80/ss/

The slant there is on SS for the amateur radio service, but it has a good bibliography with excellant pointers to books and articles on the technology.

: Is it possible?

I think so.

: I've got a MFJ-1278T, and I've got NetManage Chameleon. What do I
: need to add a driver for WinSock to KISS?

Consider trying ethrax25 which is a driver for a KISS TNC to make it appear
as a standard ethernet device.

Below is the readme from the distribution.

Glenn Elmore n6gn

amateur IP: glenn@SantaRosa.ampr.org
Internet: glenne@sr.hp.com

ETHRAX25 - Ethernet to AX.25 Packet Driver
Revision: 940530
30 May 1994

ETHRAX25 is a modified version of the ETHERSL packet driver from the
Crynwr collection. It provides an Ethernet (Class 1) interface to the
application, and produces AX.25 UI frames, encapsulated in KISS on a
serial port.

Outgoing Ethernet frames are converted into AX.25 Unnumbered
Information (UI) frames. The application sees pseudo-Ethernet
addresses which are an encoded representation of the AX.25 address.
The AX.25 frame is then encapsulated in KISS framing and sent on the
specified serial port to a KISS-mode TNC.

The reverse is done for incoming KISS frames, which are converted to
pseudo-Ethernet frames for the application.

If the frame contains an ARP packet, the driver translates the hardware
addresses between AX.25 address and pseudo-Ethernet addresses as
needed. Thus ARP works transparently. The Ethernet broadcast address
ff-ff-ff-ff-ff-ff is converted to the AX.25 broadcast address QST-0 and vice
versa.

Usage:

The driver is loaded in the same fashion as other packet drivers.
The parameters are:

ETHRAX25 <packet_int_no> [-h] [hardware_irq] [io_addr] [baud_rate]
[send_buf_size] [recv_buf_size]

-h enables hardware handshaking on the serial port.

Since the application believes it is talking to an Ethernet, there are
some AX.25 and TNC parameters which must be set before the application
is started. These are set using the AX25CONF utility:

AX25CONF <packet_int_no> [-stat] [-mycall <ax25 addr>]
[-txdelay n] [-persist n] [-slottime n] [-txtail n]

Where:
<packet_int_no> -- the interrupt number for the packet driver
-stat -- reports driver statistics
-mycall ax25addr -- sets the AX.25 address (callsign with
optional SSID)
-txdelay n -- sets the TNC's txdelay (10 msec units)
-persist n -- sets the TNC's p-persistence
-slottime n -- sets the TNC's slottime (10 msec units)
-txtail n -- sets the TNC's txtail (10 msec units)

If the driver is being used with a MS Windows application, remember to
load the WINPKT driver after loading ETHRAX25.

Caveats:

The current version of the driver has been tested with a small set of
DOS and Windows applications.

Under DOS, the driver has been tested with WATTCP (7/16/93 vintage)
and Kermit 3.13 at 9600 baud. However, since both of these IP stacks are
tuned for Ethernet or fast serial links, they are not useable over
1200 baud radio links. The driver was tested by connecting the serial
line to a system running KA9Q NOS, which was configured as if
connected to a KISS TNC. Ping, telnet, ftp, and DNS seem to work.

Under Windows, the driver has been tested with the Trumpet Winsock TCP
stack, Version 1.0 A. The overhead introduced by Windows causes packets to be
dropped when running the serial line at 9600 baud. This can probably
be fixed by using a serial port with a 16550 UART. The line works
reliably at 2400 baud.

The driver was tested running the Trumpet newsreader, the ping,
hopcheck, telnet, and ftp utilities that come with Trumpet Winsock,
and WS_FTP. All of these "worked" over a 1200 baud radio link. I put
"worked" in quotes because, while there don't appear any
driver-related problems, Trumpet Winsock TCP stack appears to have
some quirks which surface when running over something that slow.

The WS_PING utility (931003) always gets a fatal error, but that sometimes
happens when running over Ethernet as well.

Other protocols which pass hardware addresses (like BOOTP) probably
won't work without explicit support in the driver.

The assembler code was assembled with Borland TASM 2.0. The C code was compiled with Borland C++ V2.0.

Look in the comp.std.wireless newsgroup. They discuss wireless networking and also there's usually information on various spread spectrum devices. Many hams are taking these devices (part 15) and running them instead of existing packet equipment since they typically are lower cost, higher data rates, and license free. The drawback is the power restrictions with part 15 devices and typically limited distances. Many companies though have equipment that in rural areas can cover the same distances that UHF amateur packet links can cover.

2270. 28Mhz transvertors for 56Kb Grapes Modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-26 00:00:00 UTC
From: Dirk-Jan Koopman <djk@localhost>
Message-ID: <Pine.LNX.3.91.950526195527.187A-100000@dirku.demon.co.uk>
Source record: 43304

As I understand it, the Grapes 56Kb modems rely on having 28Mhz->xxx transverters most of which were made by a British company called Microwave Modules. This company no longer manufactures this range of kit (nor any other Amateur gear, I believe).

Whilst Microwave modules no longer produce 28Mhz transverters, they have passed their existing stock and manufacturing rights to another company which is run by a radio amateur.

Unfortunately he has not got internet access, but initial enquiries can be directed thru me at the address given below.

He has, in some cases substantial, stocks of the following transverters:-

28->70Mhz
28->144Mhz
28->220Mhz
28->432-436Mhz
28->432->434, 435-437Mhz

In addition he can recrystal the 220Mhz parts to 219Mhz to order. These are all priced @ STG 160 (approx $250) (any model). All are 10W output.

These are all boxed original equipment (ie not second hand). If he should run out of any model he has the rights and capability to manufacture more units.

The manufacturer has designed a 6m transverter (of higher quality, all surface mount etc etc, really designed for the DX market) priced at STG 250 (approx $390) again 10W output.

He also has the complete range of linears, of which relevant ones might be:-

10->50W 432Mhz STG 170 (approx $270)
10->100W 432Mhz STG 340 (approx $535)
10->80W 220Mhz STG 180 (approx $285)
10->100W 144Mhz STG 180 "
10->100W 50Mhz STG 180 "

Other bands/power levels are available

Carriage would be extra at cost.

I will put anybody interested in touch direct (ie he will sell to you direct, I am only the internet information gateway).

Please supply a Fax no if possible so that he can fax you the details

Kevin Jessup (kevin.jessup@mail.mei.com) wrote:

: >Don't you have to sample at twice the input frequency, i.e. 500 MHz max
: >input??

: Yes, that's what Nyquist says if you need to "totally" represent
: all of the digitized analog signal. But that's just the RF carrier,
: NOT the data of interest. The data modulating the carrier is not
: that high. So just "downconvert" it and feed it in. No big deal.

Why can't the data of interest be that wide? I know Part 15
devices aren't suppose to use certain protected areas of spectrum,
but that doesn't mean a smart engineer can't devise a modulation
scheme with spectral gaps in just the right places.

Why would one bother with such an expensive chip if you were merely
going to look at narrowband signals?

There are amateur bands wide enough to use a 900 MHz wide IF
if you want really high data rates. Not aware of any off the
shelf radios for bands like 76 GHz, but prime territory for
adventurous experimenters...

This is a QSP fm N4SR via K3ZR

Hi

Have been fooling around with the windows version of pc-pakratt
and wonder if there is a way to set up the software in the "hot key"
mode? This would be when you were in RTTY mode and your transmitter
would key when you started typing and unkey when a blank line was.
I am also curious if it's possible to set the macros up the same way,
ie when you invoke a macro it automatically starts xmitting. I don't
think that there is a way to do either of these with the windows
version
but maybe someone knows for sure if it can be done or not. Tnx for any
input.

>Thanks.....from Frustrated in Fenix. KG7JD

Fenix:

PcPackratt for Windows does exit cleanly to allow you to place the PK-232 into KISS mode and then exit the program. You can always start JNOS and do a TIP session to the comport. Here hit Ctrl C 3 times in one second then set up the PK-232's TX delay time etc, now just type KISS on and re enter jnos do a JNOS reset and you are good for NOS operation. OR start windows terminal, type Ctrl C 3 times in one second and then KISS On and exit the program. The TNC will now be in KISS mode.

You see the PcPackratt for Windows usually exits and leaves the TNC in HOST mode hence the need for hitting 3 Ctrl C's to regain command of the TNC. You can set up PcPakratt for Windows to not exit leaving the TNC in Host Mode, look in the config section of the program for that command. I just jump into JNOS and so a TIP session, it is easiest for me here, but then I run nothing else but TCP / IP as it is said " AX25 is like a watching a Black and White TV without cable or a VCR attached." :)

Have Fun !!

Gary

2283. Re: New VK regs - wormholes

Hmm, is that why everyone but fossilized amateurs are abandoning
CW? If it does such a great job, then why are the commercial and
military worlds abandoning it as quickly as possible for newer
digital methods? When everyone is out of step but you, it becomes
time to question your own pace.

[Wow, Gary, i didn't think i'd end on this side of this discussion with you!]

Because they can *afford* the newer technology and because it provides
benefits that they cannot obtain in the old way. Satellites and micro-
waves are a lot more reliable and predictable. CW has its place; we
can't have very many people running 56Kbs on HF. CW wins simply down
there simply because it's rather low bandwidth and uses the human brain
instead of analog ICs or a DSP to do the decoding, which has its place
under poor quality signal conditions. (Please note that i'm not ruling
out use of newer DSPs and clever software to compete in a DX pile-up
someday.) We can't send wide bandwidth signals world-wide in those
bands. CW is cheap, and lots of people can do it at the same time.
How many people on this list could homebrew a 19.2Kbs digital radio?
But i do wish *OUR* pace in this realm were a little faster, especially
in terms of the regs...

2287. Node name confusion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-28 00:00:00 UTC
From: tvr@cnmat.CNMAT.Berkeley.EDU
Message-ID: <TVR.95May28002305@cnmat.CNMAT.Berkeley.EDU>
Source record: 43321

I was exploring node connectivity on one of the local keyboard-to-keyboard 1.2Kbs packet channels and noticed something that concerns me. A couple of days ago, i noted a CU3 call chatting with a local Advanced class fellow, in what didn't quite look like Spanish and i presume was his (her?) native langauge. I presume the CU3 was coming in thru a wormhole, as there are several in this area. A little later, i noticed a couple of KA-nodes using calls like JL6ND and DI6ND [these are comparable examples, not actual calls], and because of the amount of traffic on the channel, i was not seeing their ID packets for quite some time. To me, this seemed rather confusing; how am i supposed to tell who's local and who's DX??

Another local ham suggested that they were doing this because the local NETROM-compatible nodes won't talk to KA-nodes. Indeed, i found out that my local node would not send to my tactical call (e.g. node name), either. It seems to reject anything that doesn't have a digit in it, or has sent out a NETROM packet to tactical call NODES (presumably with an appropriate "signature byte" [FF]). Now, if they had used something like XYZ6ND, which has too many letters in front of it to be a callsign in our service, then i might not even noticed. But i really can't tell who i'm talking to here.

Is this kosher??? What *should* we do about these NETROM vs. "wild node" disputations?
-- KD6PAG (networking old-timer, RF newbie)

>in terms of the regs...

You're looking at apples and oranges. Yes, present techniques won't let us use 56kb on HF, but that's not the point. We *can* send 60WPM error free through a 63 Hz bandwidth with presently realizable technique. That's 2 to 3 times better than most Extras can achieve on CW. And, we can do that using less power and under worse conditions than the CW operator must have as well. More importantly, radio equipment designed from scratch to be optimized for digital operation can be of the same order of cost and apparent simplicity as the CW stations used by those operators.

You ask how many people on this list could homebrew a 19.2 kbs digital radio. My answer is about the same number who can master 13 WPM 70% error free Morse in the same study time. Actually, I would expect most could master the technology in substantially less time than was required for them to reach minimal Morse competency. And for that effort, they gain about 2110 times as much performance as they would have using Morse at that level. Now if that isn't a good deal, I don't know what is.

Gary

Why should you care? Anything on your side of a node is local. Anything on the other side of the node is in the network "cloud". Just where in the cloud it is, or how it got there, isn't important to anyone but the network maintainer. When you connect to another network user somewhere on the other side of the cloud, he can tell you where he is.

I may be missing something here, but it seems to me that all your connections to the network are local. Any Dxing being done is being done by the network, not by you.

G';day All,
I was wondering if anyone out there has built up some equipment to do speeds higher than 9k6 over packet radio? I know about the GRAPES gear but was looking for some things that you can get as a kit and don't need transverters.

I have heard of people fiddling around with 1Mbps stuff before,which would be quire interesting. It doesn't have to go far, only a few km/miles.

A few of us around my local area are looking to move to higher speeds, but we don't want to re-invent the wheel (just improve or copy it perhaps).

- Craig vk2xlz

DIGITAL OPERATORS TO BE INVITED TO

SERA SUMMER BOARD MEETING

5/28/95

This message is about packet/digital communication, band-planning, frequency coordination, and the SouthEastern Repeater Association.

Representatives from the digital community in the 8 SERA states* will be invited to the SERA board meeting in Knoxville this July to discuss how SERA and the digital groups can better communicate and cooperate. This message is being sent from the North Carolina digital groups, Packet>East and CDCC (Carolina Digital Coordinating Council). Now some details:

As you may know, SERA revised its UHF band plan last year. The band plan covers the entire band, 420 - 450 MHz, and affects all modes using the band. There were significant changes made for digital operation. Channels have been set aside for both narrowband and wideband digital, some with 5 MHz offsets that can be used as repeaters or duplex link channels. This band plan offers digital operators a lot more than we've had under the old ARRL plan, and it offers structure and order for future growth, rather than the uncoordinated hodge-podge of frequency utilization we have now.

While this looks good, it didn't sit well with many of the node and BBS sysops here in North Carolina. We didn't like being handed a band plan we didn't help write, and we resented it being administered by "someone else" -- SERA. We did recognize that the plan had a lot to offer, and was something we needed. We also recognize that the band plan is just a start, and further coordination is needed to help systems work together under the plan.

I wrote to SERA on behalf of Packet>East, and was invited to attend the January '95 board meeting. There I learned that SERA does NOT want to administer a digital band plan, at least not beyond being the coordinating body for digital repeaters. And it does NOT want to take over the jobs of the existing digital groups.

But SERA does want to find a way to bring representation from digital operators onto the SERA board, and make its resources available to the digital community.

As a guest at the January meeting, I proposed this idea for the summer meeting: The SERA board meets Saturday afternoon and Sunday morning. I proposed that digital groups meet separately on Saturday, to discuss what the problems and needs are in the RF area of digital, how SERA can help

solve those problems, and how we think we could be a part of SERA. On Sunday, we would meet with the SERA board to present our conclusions. (SERA will provide a meeting room for us on Saturday at no cost.)

The options for participation are pretty wide open. Again, SERA does NOT want to absorb or take over any existing digital groups. But one idea floated is to add to the board an assistant Director for digital in each SERA state. This would be a voting position to represent digital interests in spectrum management, and that person may handle digital frequency coordination. This is just a starting point, and questions like "who would elect this person" are undecided.

The next step is to invite participants to the meeting, to be held in July in Knoxville (the exact date isn't available yet). If you are interested, I would like to hear from you, ASAP. SERA President Dave Shiplett, AC4MU, and I will be sending invitations soon. I'd like to know a little about your involvement in packet/digital, and what groups exist in your state, but I think anyone with a serious interest in planning and coordinating the RF end of amateur VHF/UHF digital should be there.

You can reach me at these addresses:

Gary Pearce KN4AQ
4400 Bleeker Ct.
Raleigh, NC 27606

packet: KN4AQ @ N1GMV.#RTP.NC.US.NOAM

internet: kn4aq.gary@mms.raleigh.nc.us

telephone: 919-233-8306

PLEASE FORWARD THIS MESSAGE to anyone you know who might be interested! As you know, packet bulletins can be easily lost in the shuffle, and it would be really great if the interested people saw this message.

Thanks and 73,

Gary KN4AQ
Vice President,

Source record: 43335

My telephone modem was not in use a couple of months. Is it an internal one model with MNP5 at 2400 bd. It worked well for years, but now I recognize it could not be initialized properly unless is it run Terminal utility from Windows. Even then I don't use Terminal, because modem is on COM4, mouse on COM2 and packet modem on COM1. This situation couldn't be changed because both modems must stay as they are for the use of FBB bbs software with both packet and telephone modem access. So, I'd rather not expect proposals about changing the COM ports...because, everything worked fine just a couple of months ago. I didn't changed any phone modem's config files at all.

Fed Stnd 1016 uses Code Excited Linear Prediction (CELP) , Analog to Digital
Conversion of Radio Voice by 4,800 Bit/Second. There is also a 9600 Celp
standard but I have yet to dig that one up. I will give more info later when I
dig up the folder on it. I have heard there is an implementation on ti.com
using the texas instrument tms320c50 dsp chip. Let me know what you find out.

2305. Voice coder?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-29 00:00:00 UTC
From: mkeitz@bev.net
Message-ID: <3qdiaj$j73@solaris.cc.vt.edu>
Source record: 43339

Does anyone have any experience with voice coders? I'm looking for something that can pass "ham-grade" compressed voice through a link with a throughput of 9600 bps, and good quality audio (i.e. sounds like local 2m FM) at 19200. I heard something about one that works OK at 4800, but I don't remember what it was. I believe this is beyond what a CVSD can achieve. Is this kind of stuff all proprietary, or does someone have something out in public domain? Maybe whatever I-Phone (ugh) uses?

I'm looking for a PC Card (PCMCIA Card) with a DSP on board.
Something like a Soundcard or customizable modem.

I would really appreciate any leads

While not quite into VHF, you could try the Analog Devices stuff - the
AD7008 is fairly reasonable (50MHz clock, up to 20MHz out) and can get
to VHF with the help of a mixer and oscillator.

From: jwl@dogwood.cray.com
Message-ID: <1995May30.103120.6589@walter.cray.com>
Source record: 43194

I haven't heard anything for quite a while concerning unattended operation
on HF. Last I heard either the ARRL had proposed or the FCC was considering
permitting semi-automatic operation where at least one station had to
be attended. Have I missed something or is there just no information?

Thanks,
Jim.

Here are the CORRECT attach commands for dualport tnc's

first attach your tnc then attach the second port of the tnc
attach asy 03f8 4 ax25 tnc0 512 256 9600
attach kiss tnc0 1 tnc2

also you may want to download the cmdshlp3.zip file ftp ftp.ucsd.edu
/hamradio/
packet/tcpip/incoming and look at the attach information in that file. I
explains it also.

2311. KNWD TR2600A/PK232 Interface Problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-30 00:00:00 UTC
From: jschwart@ix.netcom.com
Message-ID: <3qfr9v$1bq@ixnews2.ix.netcom.com>
Source record: 43196

In interfacing a Kenwood TR2600A 2 meter HT to a PK232 (upgraded to PK232MBX), I've encountered a problem. Perhaps a reader has faced ther same problem and can offer some help.

I've built the TNC to radio cable as specified in Appendix K of the PK232 dox, including the 0.1 mmF capacitor on the specified line (PTT as I recall). However, when I plug the cable into the radio (mic and speaker), the radio keys continuously. The radio unkeys when I remove the speaker plug. The radio doc shows that PTT engages when the PTT line (ring on the mic plug) is shorted to ground (sleeve on the speaker plug/jack). I have also jockeyed the value of the capacitor, but with no change in results. I have also checked the cable alone for shorts, of which there are none.

I have also used an oscilliscope to check the TNC keying circuit. Without the cable attached to the TNC, the voltage increases about 1.5 VDC between the PTT line and the ground line of the TNC's radio port.

I know this isn't brain surgery, and the TNC appears to be working satisfactorily. I've interfaced many other radios to other TNC's, with litte problem, but don't seem to see the issue here. Any help?

Thanks in advance,

John

I have in my posession more than a few digital recievers that go to the 900 MHz band. Complete scanning and memory capabilities, re-chargable NiCd battery/Wall converter, antenna included. With these recievers you can moniter cellular telephone conversations, and boy they're funny. You can not moniter a specific person and listen to all their calls, but you can scan around to see if the said person has made a second call pretty easy.

If interested, make offer to: <psu02508@odin.cc.pdx.edu>

Source record: 43201

Hi All,

I am trying to hang a 2400 baud modem off the back of our JNOS
BPQ switch (with DX Cluster). I know that a SLIP or PPP device
can be used with a modem, but I'd like to be able to just
dial in to JNOS using a simple vt100-like terminal and another
modem across the phone network. Does anyone know if there are
any patches to 110 (j?) that support this? I'd like to know
if someone has already been there, before I consider writing
something myself.

Thanks all,

>Especially faxreceive programs, sattracking software.
>Running OS/2 WARP no windows

Try hobbes.nmsu.edu in the network/tcpip directory for PM nos. Windows
has Sat trackers that will run seamless in warp, without hogging mem. It's
probably better to try that than wait for os/2 sat trackers, and there's alot more
available. I'm sure that someone will port a tracker to pm soon, tho.
Take care, 73 de Curtis, kd4zkw

This reminds me of the time one of my neighbors complained of
interference to her cordless telephone from my ham gear. Being quick of
mind that particular day, I responded, "Oh, I was wondering who had the
cordless phone in the neighborhood. I must apologize to you, but when I
am on my ham radio and you use your cordless phone, I have to listen to
your phone conversations. Not that I mean to." She turned a brilliant
shade of red and left apologizing. Never complained again.
I've always wondered what she was talking about on the phone that
would be so embarrasing. :)

PARA LOS RADIOAFICIONADOS HISPANOS EN INTERNET

RADIO INTERNET EN ESPANOL

A todos los radioaficionados hispanos que lean este E-Mail los invitamos a escuchar RADIO INTERNET EN ESPANOL que se transmite por esta red. Para hacerlo solo sigan las instrucciones y si tienen cualquier consulta escriban a miglia@ix.netcom.com.

EL TERCER PROGRAMA DE RADIO VIA INTERNET ESTA YA ON LINE, ESCUCHELO.

Tal cual lo programado a las 11:59 PM del Sabado 27 de Mayo fue colocado en nuestro FTP el tercer programa de Radio en Espanol Via Internet y como ya se volvio casi custumbre los radio escuchas comenzaron a bajarlo solo pasados algunos minutos de la media noche. Es notable ver desde que remotas latitudes hay latinoamericanos que ingresan a disfrutar de esta experiencia, nunca pensamos que nuestra gente estaba repartida por toda la tierra como lo esta. A todos muchas gracias por escucharnos y aqui algo de informacion:

Programacion Radio Internet en Espanol

051495.ra Primer Programa Tema Central "Internet Phone" Como Hablar Via Internet (New HF)

052195.ra Segundo Programa Tema Central "Videoconferencia Via Internet"

052895.ra Tercer Programa Variedad de Temas y Demostracion Internet Phone

Espanol.ra Archivo formato .ra para test

Leame.txt Este archivo

SINTONICE RADIO INTERNET EN ESPANOL YA ESTAMOS TRANSMITIENDO VIA LA RED

Si ahora es posible escuchar radio via Internet y nosotros pensamos que sera esta la nueva opcion que reemplazara las antiguas y ruidosas transmisiones de onda corta.
El proximo domingo 14 de Mayo comenzaran las transmisiones de los PROGRAMAS DE RADIO EN ESPANOL VIA INTERNET, dichos programas estaran disponibles en el FTP de nombre FTP.NETCOM.COM en los directorios /pub/mi/miglia y bajo el nombre correspondiende a la fecha de emision, por ejemplo este domingo 14 de mayo el file conteniendo al programa se llamara 051495.ra

FTP: FTP.NETCOM.COM
DIRECTORIO: /pub
SUBDIRECTORIO: mi

SUBDIRECTORIO: miglia
FILE: 051495.ra

PARA ESCUCHAR NUESTRO PROGRAMA DE RADIO EN ESPANOL VIA INTERNET

Para poder escuchar nuestro programa de radio en espanol debera contar con un software llamado RealAudio Player, una PC con Windows 3.1 y una tarjeta de audio. RealAudio lo podra obtener "SIN CARGO" dentro de Internet en:

http://www.realaudio.com/

Cuando este comunicado con esta pagina seleccione:
"donwload your own copy of the RealAudio Player"

Y siga las instrucciones completando la forma correspondiente con sus datos personales, las caracteristicas de su computador y por ultimo el tipo de cuenta en internet que esta usted utilizando. Esto lo ayudara:

A. Ingrese todos sus datos personales
B. Internet Connection = PPP
C. Provider = Por ejemplo NI.NET
D. Speed = 14.400 Baud
E. Machine and Sound = 486 DX2 66MHZ - Windows 3.1 - 8 MB - 340 MB Disco
F. Coloque su nombre el principio del PRE-REASE AGREEMENT

Completada esta informacion RealAudio le enviara de inmediato via
E-Mail un numero de registracion y un password. Con estos datos entonces regrese a http://www.realaudio.com/ y efectue el download del programa RealAudio Player.

1.- El programa obtenido (RealAudio Player) tendra un nombre similar a raplay07.exe.
2.- Ejecutelo colocando el comando raplay07.exe y ENTER.
3.- Este programa al ejecutarse genera un directorio de nombre RAPLAYER.
4.- Dentro de ese directorio encontrara el programa pnclient.exe que es el que utilizara para escucharnos.

Ahora bien para obtener nuestros programas de radio ingrese como ANONYMOUS al siguiente ftp:

FTP: ftp.netcom.com
DIRECTORIO: \pub
SUBDIRECTORIO: mi
SUBDIRECTORIO: miglia

O sea: ftp.netcom.com/pub/mi/miglia

Como Operar pnclient.exe desde Windows:

- Ejecute pnclient.exe
- Habra con el mouse el cuadradito superior izquierdo
- Selecciones Load...
- Seleccione Local File
- Con la ayuda de Browse... busque el file del programa con terminacion .ra en

su disco y seleccionelo.
- Oprima OK y disfrute de nuestros programas.

ESCUCHE CADA DOMINGO NUESTRO PROGRAMA DE RADIO EN ESPANOL VIA INTERNET
EL 21 MAYO TRATAREMOS COMO TEMA PRINCIPAL "VIDEOCONFERENCIA O TRANSMISION DE VIDEO COLOR VIA INTERNET CON UNA PC Y WINDOWS" FILE 052195.ra

Nota: A los 1.050 usuarios de internet que nos escribieron respecto a nuestro programa de radio, gracias.

George Migliarini
E-Mail: miglia@ix.netcom.com

2322. HABLAR VIA INTERNET Si ahora es posible

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-05-31 00:00:00 UTC
From: miglia@ix.netcom.com
Message-ID: <NEWTNews.25853.801935127.miglia1@miglia1.gmtech.com>
Source record: 43207
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc,rec.radio.amateur.antenna

ESTAN LAS BANDAS DE HF DESAPARECIENDO ?

Los amantes de las comunicaciones tienen ahora otra modalidad disponible y se trata de INTERNET PHONE, si asi como lo leen ﷿Hablar via Internet﷿ este sera el fin de las bandas de HF o solo un reemplazo cuando las condiciones de propagacion no nos ayuden. Para hablar por internet solo siga las instrucciones y les recomendamos escuchar nuestros programas en espanol de RADIO INTERNET EN ESPANOL, para ello busque mas informacion de como hacerlo aqui mismo o escriba a miglia@ix.netcom.com

Por ultimo los que tengan Internet Phone listo y operativo les regamos nos lo hagan conocer a nuestro E-Mail. Gracias.

AHORA PODEMOS HABLAR POR TELEFONO VIA INTERNET PHONE

Es dificil de creer pero miles de usuarios estan hablando via la red INTERNET y si usted tambien quiere hacerlo aqui le damos toda la informacion necesaria para poder realizarlo y contestamos algunas preguntas tambien:

Pregunta: Cual es el costo para poder hablar via INTERNET PHONE
Respuesta: Ni un centavo mas de lo que paga actualmente por su cuenta

Pregunta: Se escucha claro
Respuesta: Lo mismo que una llamada telefonica internacional

Pregunta: A donde puedo hablar via INTERNET PHONE
Respuesta: A cualquier parte del mundo

Pregunta: Con quien puedo hablar via INTERNET PHONE
Respuesta: Con cualquiera usuario de internet que este On Line y tenga INTERNET PHONE

COMO HABLAR VIA INTERNET

Para poder hablar por telefono via Internet hay que tener los siguientes elementos:

486 PC Computer
8 MB RAM
Windows 3.1
Winsock 1.1 compatible TCP/IP y coneccion a internet 14,400 baud modem (SLIP/PPP)
Tarjeta de audio compatible con Windows
Programa Iphone (Demo o version registrada)

Si esta confundido con los terminos TCP/IP y SLIP/PPP consulte con quien le da su servicio internet y pregunte si su cuenta reune estas condiciones. Respecto al programa Winsock 1.1 o compatible esta dispoble sin costo via Internet.
Ahora bien la tarjeta de audio debe reunir la condicion de ser Windows compatible como el caso de Sound Blaster por ejemplo. Por ultimo le hara falta el programa IPHONE el cual lo puede obtener sin cargo en su version demo o pagando por la version definitiva.
Teniendo todos estos elementos usted podra entonces conversar con otros usuarios que esten On Line y que tengan tambien Internet Phone no importando en que parte del mundo esten y lo mas interesante no pagara nada adicional por este servicio solo lo que actualmente esta pagando. Para tener una idea NETCOM ofrece el servicio windows Netcruiser por $19 dolares al mes con 20 horas prime time y free el resto, esta cuenta reune las condiciones para utilizar IPHONE. Con Netcom no hace falta Winsock 1.1 esta ya incluido.

Para obtener IPHONE Demo (Sin Cargo) ingresar a:

http:///www.vocaltec.com/

Hacer el download del programa y seguir las instrucciones, el costo de la version registrada es de $59.00.

IPHONE Vocaltec Inc. (201) 768-9400 o E-Mail info@vocaltec.com

For Winsock Trumpet send E-Mail to tech-support@trumpet.com.au o busque que hay muchas versiones sin cargo en internet como por ejemplo ftp.utas.edu.au

LA CALIDAD DE LA VOZ VIA IPHONE ES CLARA LOS ESPERO ON LINE PARA CHARLAR

Prof. at any univerists
Professor wanted to work as an advisor part of a team to do a CW MORSE
project using TI DSP tms 320c3x, or c4x, c5x or c8x (if beta avail.)
see contest rules in http://www.ti.com in the dsp area under univ. programs
it is the ti dsp solution challege... the advisor to the team may get a $15k
prize & an offer for a 6 month sabatical from ti if they wanted it...

we have a project laid out for an entry & are building a small team...
will ask ti for some waiver to present rules like the right to buy back the
design at cost after taking development expenses againt the prize, if won.
looking for a winning team... score goal is 150 points wiht toher factors
wiht a two undergrad & one master grad using max difficulty of 5 x 2.6 x9
(for merit) it is close to a 120 score... projected manhours max 2500
mid 1000 min 700...

I have a mint used once only Eagle AccuNav Sport GPS Reciever plus many accessories for sale. Accessories include the nice cordura portable carrying case, a spare battery pack, the external antenna assembly which has never been used, and a real nice video that will instruct you how to use it, and take advantage of it.
This is a real nice handheld GPS reciever and has a NMEA output jack for all of you APRS users.
Price: $400.00 FIRM...I'll ship...
If COD, you pay the COD charges....

-Tim, N9ABK
Please EMAIL me if interested.

Hi all

Does any one have information on the Digital squelch that is comming into use on more and more Non-Ham radio nets? I know it is a digital sequence sent like CTCSS only it is decodes for its numerical value instead of its frequency.

What I am looking for is the specifics:

Format
Data rate
Code length
Shift (modulation level)
Waveform

Thank you all. Clark KA2NWL

>Brad, KB0HNN
>johanb01@tigger.stcloud.msus.edu

ftp://ftp.ucsd.udu/hamradio/packet/tcpip/ka9q

Phil hasn't done any changes to his software in a long time. The version everyone is porting from seems to be jnos, which should be in the /packet/tcpip/incoming directory (do a "dir -rt" to see what's been uploaded last).

There's a lot of room for TCP/IP development. The ham bands are pretty sad with all the Host mode crap. If you can get a 9600 repeater group formed, I think you will see some pretty decent TCP/IP activity. At 1200 TCP/IP really sucks. But then ROSE, Netrom, and everything really sucks at 1200...

Good luck,

Steve/n5owk

P.S. Don't forget to look up "Packet Radio" with your WWW browser.

Hello OM
Regarding controlling ur computer from ur office i am using 2 ways.
first if i want to control my packet station at home from my office
which i am doing all the times.
i have my TNC PK232MBX and using F6FBB program i just start up the
program befor leaving home and when i reach office simply i call my bbs
via land line and login and i have full control like monitoring all the
traffic on the band connect to another stations or start or stop
forwarding by another word just like when i am at home and its easy and
fine very pleased about it..
if i want to use my computer NOT packet i just setup my CLOSEUP program
b4 leaving home its like setting at home..
hope this w,ll help you.. and if u need any more info u can send me
E-mail

IEEE standards are not publicly (freely) available.

IETF documents, though, are, from many places, including:

gopher: gopher.internic.net

Web: http://www.internic.net

In either case, from the main menu, select:

AT&T Corp. Directory and Database Services

Internet Documents (RFC's, FYI's...) and IETF Information

You take the wheel from there.

2351. KANTRONICS DATA ENGINE help!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-01 00:00:00 UTC
From: root@lenin.svl.trw.com
Message-ID: <3qjbks$851@gatekeeper.svl.trw.com>
Source record: 43232

Well, I finally recovered my Data Engine from my ex-wife. I was
amazed to find that the clock was still running (4 years and only 75
minutes off) and the PBBS held messages. But I don't have a manual
and Kantronics ads don't mention the product anymore, so :

1) Anybody have a manual I can obtain?

2) Anybody know any software for this unit?

Thanks, ron N6VUW

I believe that there are some vhf wefax transmissions to pick up even though
I haven't gotten into Wefax.

The GPS is used for tracking via avery popular program called APRS for packet.
gps sends signals to a satelite and it identifies your position in lat and lon
down to a few yards. APRS (amature packet reporting system) utilises the
positions from the GPS to report to all who use the program your location in
real time.

If you would like more info on this.....E-mail me at rrross@delphi.com and I
will upload good info files on the subject!

Source record: 43237

Has anyone had experience using a MFJ 1278 TNC working TCP/IP. I am using NOS TCP/IP software and that seems to be working, at least I think so at this point. I have reconstructed the necessary files from the NOSland demo files that were setup to test and learn the program. The MFJ seems to go into KISS mode fine, at least the necessary LEDs blink three times as indicated that they should. I cannot get the telnet function to work, nor can I make an AX25 connection in the manner described in NOSintro. (At least the 2-meter xcvr dosen't key.) I can terminate out of TCP/IP, reset the TNC to command mode and make an AX25 connection that way, but I can't seem to get it to work the other way. At the momement I'm locked up in KISS mode so I will have to pull the backup battery in the TNC to do a hard (sic) reset. I have trouble with the tncreset.scr and tncreset.dia running correctly. I wonder if the timming interval between commands is a problem as well? I set the interval to 500 milliseconds. I wonder if I should go to 1000? I've checked files and setting parameters; they seem to be ok, but all is not well. Would appreciate some help/advice. Thanks. Incidentally, I'm running NOS 304; are there known bugs?

I'm pretty new at the whole mess, but the KPC-3 I got says that also. My
guess is that it means it will work for those things now, if you want to
use this TNC for that purpose. WEFAX does indeed seem to still be HF, and
the GPS stuff is pretty standard: You still have to have the GPS itself,
you just get to pass the NMEA output thru it to your PC. What you do with
it then is up to you.

DAB is Digital Audio Broadcasting

As usual there are two incompatible versions: US and Europe.

US version is believed to have one audio program per carrier,
the European version has five (more suitable for national networks).

Coding is complex, I dont know the details.

Transmission can be satellite or terrestrial.

In UK experiments are taking place around 230 MHz terrestrial
(top of TV band 3).

Hope this helps

Gerry

As another poster has said Digital Audio Broadcasting. Uses digits and
hundereds of carriers to provide several near CD quality radio services.

It is very multipath resistant. Ideal for mobile use.
John b.

> Thank you,
> Mike - N5PSI

The problem is that the FM signal from the satellite is wideband -
you will need a receiver with at least 35 KHz (preferably 40) IF
bandpass - the peak deviation from the NOAA birds is +/- 17 KHz. The
average scanner or receiver doesn't cut it, and a converted
broadcast-type FM receiver is too wide (hence noisy).

Quorum makes an all-in-one (receiver and interface) PC card. I've
heard that they're pretty good......I think they advertise in "73"
magazine....you might also check out Vanguard - they have an external
receiver for this purpose.

2370. Wiring TM-733A data connector?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-02 00:00:00 UTC
From: rwp@fc.hp.com
Message-ID: <3qm8ul$2sa@tadpole.fc.hp.com>
Source record: 43155

Has anyone actually used the TM-733A with the data connector on the front panel? There does not seem to be a PTT wire!

From the docs:

```
Pin Pin Function
Number Name
------------------------
1 PKD Packet data input
* Transmit data from TNC to transceiver
2 DE Ground for PKD
3 PKS Packet standby
* TNC can use this pin to inhibit the transceiver
microphone input while transmitting packet signals
4 PR9 Detects 9600 bps data. (500mV p-p / 10kohm)
5 PR1 Detects 1200 bps data. (300mV p-p / 10kohm)
6 SQC Squelch control output
* Inhibits TNC data transmit while transceiver squelch
is open.
* Output level
Open squelch: +5V (high)
Closed squelch: 0V (low)
```

And that is all it says. Looking at the schematics (block diagrams really) does not give me any more information either. Do I also have to make a microphone clip adaptor too and plug into both connectors and grab the PTT from the microphone input?

This looks like it would be a standard connector that might appear in an identical fashion on other radios. What do other radio docs say about this?

Can't help unfortunately - I got two by talking nicely to the sales rep
at work and giving him an order for several hundred quid for other bits
at the same time so he managed to get me a couple. I have a suspicion
they were acquired from AD as 'samples' because they arrived in separate
parcels (a single 44-PLCC in a package about 18 inches long by about
four square :-))

BP>.@SUBJECT:Wiring TM-733A data connector?

BP>Has anyone actually used the TM-733A with the data connector on the
BP>front panel? There does not seem to be a PTT wire!

Bob, I have a '733 and the data connector is a 6-pin Mini-DIN plug.
When I first bought the radio I was told even Kenwood didn't have
them. I bought a Keyboard extension cable for a couple of bucks that
had one of the plugs on one end. The plugs are becoming quite common
now. I haven't checked but even Radio Shack may have them now.

Pin 3 is the PTT.

The US is working on at least two systems, totally incompatible
with each other and with the European standard of course. The first
is for use by satellite and a new class of terrestrial broadcasters,
is single signal per carrier, uses rather mundane coding, and operates
in the 1.8 GHz spectrum. This is very unpopular with existing broadcasters
since they see the satellite signals taking much of their market, and
because they'd have to erect totally new broadcast plants. The second is
much more interesting, operates in the Standard AM Broadcast Band (or
the FM Broadcast Band), is fully compatible with ordinary AM or FM
transmissions sharing the same channel, and uses a complex spread
spectrum coding that is very resistant to the ordinary ills of the
Standard Broadcast Band. The coding gain is such that a 50 watt DAB
signal has similar coverage to a 5,000 watt AM signal, but retaining
full fidelity and having very high noise immunity. It's also very
resistant to multipath. Existing broadcasters who have been shown this
system, especially the AM boys, love it. They can simulcast it with their
existing AM and FM services and not have to build completely new plants,
or face new competition from space. I've seen a demo of this system
operating in a hostile mobile AM environment (Cincinati, OH).
It's awesome. It's always there anywhere the AM signal can be heard,
and lots of places where the AM signal is unintelligble it's still
flawless. When it does fail, it mutes rather than going to hash.

2377. Tropo Scatter Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-02 00:00:00 UTC
From: rwhiting@winternet.com
Message-ID: <3qnpcg$n9h@blackice.winternet.com>

Is tropo scatter, e.g., on 6M, usable for packet radio links? Is there a multipath problem that would effect maximum baud rate?

>multipath problem that would effect maximum baud rate?

Yes and yes, but the multipath affects *minimum* baud rate too. The symbols must be significantly longer or shorter in duration than the average multipath induced fade in order to get through in a form recoverable at the receiver. Very fast or very slow works, it's the mid-speeds that are a problem. Regulations limit our top speeds on 6m, so we have to slow down, and use signal recovery techniques that are tolerant of mid-symbol dropouts, to get good results.

A detector that oversamples across the bit period, not just doing a single sample at bit center, will work best.

2382. Wiring KPC-3 to Radio?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-03 00:00:00 UTC
From: danb@acme.csusb.edu
Message-ID: <3qq4om$9c2@news.csus.edu>
Source record: 43167

I recently purchased a KPC-3, and I'm getting ready to wire up
the connections to my radio (the much-maligned HTX-202). I'm unclear
about one thing, though. The reference manual (p. 100) says, "If you
plan to operate with a hand-held transciever, the KPC-3 has incorporated
an isolation circuit which is available by positioning jumper J2 on the
center post and the left post (labeled HT) as you face the front of the
KPC-3."

My question: When I wire the connector, do I need to (1) wire in
the 0.1uF cap and 2.2k resistor and set J2 to HT, (2) only set J2 to HT,
or (3) only wire in the cap and resistor?

Thanks for any help!

I believe the propblem to be that the PTT polarity is wrong for the radio.
To change:

Remove 6 screws, 4-cover and 2-rear, and remove cover while not disturbing
the battery wires (old manual).

JMP-2 and JMP-3 are the polarity jumpers for Radio-1 and Radio-2.
Locate them near the R-1/R-2 switch (SW2). Jumper middle pin to front
for positive PTT and middle to rear pin for negative PTT.

Replace cover after testing.

You're looking at apples and oranges. Yes, present techniques won't
let us use 56kb on HF, but that's not the point. We *can* send 60WPM
error free through a 63 Hz bandwidth with presently realizable technique.
That's 2 to 3 times better than most Extras can achieve on CW. And,
we can do that using less power and under worse conditions than the
CW operator must have as well.

Please explain! I thought we were limited to 300 baud, or using ASCII
about 30 characters per second. Not great for data, but i remember
that a model 33 Teletype could type about as fast as i could, at least,
in bursts, and that was only 10 cps. Now, 60 WPM means 1 word per second,
and that's 5 cps (maybe 6 if you count the spaces). Not as fast as some
people can type from copy, but comparing this to CW, that's a considerable
improvement, as you well point out. With suitable buffering, that should
work very nicely for comparable purposes. Hmmm...

Now, doing this in a lot less bandwidth than RTTY and error correction,
under worse conditions than CW?? That deserves some explanation!

... More importantly, radio equipment
designed from scratch to be optimized for digital operation can be
of the same order of cost and apparent simplicity as the CW stations
used by those operators.

I studied carefully the R2/T2 pair, and have thought about doing such
for 10m and above (noting that some of the RS birds go in on 2m and out
on 10m) Does that mean it's simple enough to be a QST project, albeit
probably not as easy as a QRP rig?

There must be some problem here i don't get, such as it's in a mode
that we can't use yet in HF... But wait, i might still be able to have
fun with such a device at 6m and above, where we can try out new coding
schemes. Please, tell more, and if you want to UUENCODE diagrams and/or
schematics in some well-known format, i'll even put it in my WWW page for
others to access.

A friend of mine got PMNOS.EXE for his OS/2 system. He is running the
WG7J version of NOS under a DOS window. he then unarchived the PMNOS and
put the pnnos.exe is the same directry that he has nos.exe in. when he trys
to run PMNOS he get the error msg.

CAN NOT FIND PARAMETERS or something of that order.

Any way, PMNOS is NOT finding the Autoexec file or cannot read a entry in.
Also when he attempts to enter the ATTACH command manually, it balks

Can someone that is running PMNOS, send me a copy of their Autoexec.nos
file..
Also can he ue the same files he has setup and ect.
Also does he have to install the PI drv that came with it. The docs mention
it is for a perticular board, which he doesn't have.

>are several in this area. A little later, i noticed a couple of KA-nodes
>using calls like JL6ND and DI6ND [these are comparable examples, not actual
>calls], and because of the amount of traffic on the channel, i was not
>seeing their ID packets for quite some time. To me, this seemed rather
>confusing; how am i supposed to tell who's local and who's DX??

Why should you care? Anything on your side of a node is local. Anything
on the other side of the node is in the network "cloud". Just where in
the cloud it is, or how it got there, isn't important to anyone but the
network maintainer. When you connect to another network user somewhere
on the other side of the cloud, he can tell you where he is.

Maybe i'm missing something. My understanding when i took my test was that
except in an emergency, we are only allowed to talk to others in the amateur
service, locally or internationally. For example, if some jerk keys up one
of our local repeaters (and many do), we are supposed to ignore him [it's
always been a 'him' around here, as far as i can tell]. If we go beyond
giving a QST that said repeater is for amateur use only, and engage in a
QSO with such an individual, then we, too, are technically in violation.
And it's hard to get other hams to pay attention to this point.

As a consequence of all the troubles that 2 meters (and now also 440) is
having in the S.F. Bay Area, i'm perhaps overly concerned about knowing
who i'm really talking to. But there's a practical point to this. If a
s station comes up on one of the local nodes with a foreign call, i may
want to go out of my way to make contact once the current QSO is finished.
I may just want to talk a modest distanct, for example, i answered a
packet CQ from Ashland, Oregon when i was packet portable in Berkeley.
How am i supposed to tell (1) who i might want to talk to, (2) what kind
of station they are, (3) who they really are without connecting (which may
not be possible of propagation isn't favorable and/or symmetric), and (4)
who is legit. If people are putting digits in the middle of their pscket
address rather than having tactical calls which are either all letters,
include a '#' or have digits in places that rule out a normal callsign,
then how am i supposed to tell what they are??

If i'm a acting as a node (and i've been hacking in those directions),
then i have another set of problems beyond the scope of this discussion.

I may be missing something here, but it seems to me that all your
connections to the network are local. Any Dxing being done is being

done by the network, not by you.

I don't know whether i'm missing something, or you are; i'll wait for your response to try to figure that one out. If i connect thru a series of nodes from Oakland, Californa to Corvallis, Oregon (ignoring, for the moment, opening the can of worms that the Internet provides...), then i guess i'm DXing, giving that many of these nodes probably aren't intended for this purpose, and seem to be as changable as HF conditions (as best i understand them). I am making the connections, the nodes are merely following my instuctions as best as they can (which isn't always very good). At any rate, these are little details which obscure the question of what should be an address in an AX.25 packet.

We are limited to 300 baud on our HF bands below 10 meters by 97.305, and on 10 meters we are limited to 1200 baud. However, note well that baud is a technical signaling term, and baud does not have to equal bits per second. It's common to overload a single baud with multiple bits. All modern telco modems do it. I'm not speaking about use of such techniques above, however, since they aren't necessary to get the performance I quoted. The signaling technique I was alluding to was simple MSK. Adding FEC etc would reduce the effective data rate from the raw numbers quoted. Sorry if I didn't separate those two ideas clearly.

The 60WPM figure is for a raw Baudot alphabet without error correction at 45 baud using MSK modulation. The 1.4 Hz/baud figure would apply to any alphabet of course. For example, we are limited to an occupied bandwidth of 1 kHz on the lower HF bands for data transmissions. Using MSK, we could run up to 714 baud in that bandwidth if baud higher than 300 were permissible. Using symbol overloading so that one baud represented more than one bit would increase our effective bps even further, of course. Examples of that sort of thing are QPSK and QAM. Those techniques aren't as parsimonious of spectrum as MSK though when SNR is included in the equation, IE we'd have to run higher power to get the same BER and thus limit frequency reuse to an extent.

Now 97.309(a) limits the alphabets we can transmit on HF to Baudot, ASCII, and ISO646. So we can't use unspecified alphabets on HF. But that does not limit how we generate modulations to transfer those alphabets, IE how we express those patterns of ones and zeros as RF, nor does it prohibit us from using higher level protocols to facilitate the transmission of those alphabets, IE block codes, FEC, etc. Nor does it limit us in what those alphabets may *spell*. For example, we can transmit binary files by UUencoding them into the ASCII alphabet. Being restricted to only 3 alphabets is a burden, but not a serious one. We've had to deal with such limitations on computer networks for years. An 8 bit alphabet would be more natural, but we can live with the limitations of a 7 bit alphabet, albeit with considerable unnecessary overhead.

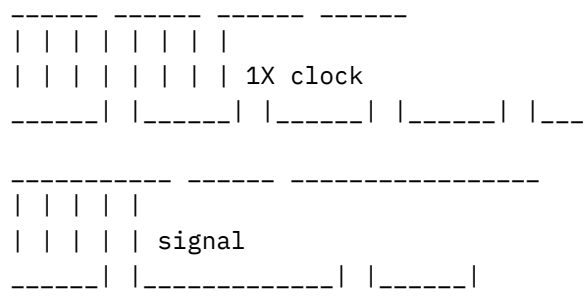
>on 10m) Does that mean it's simple enough to be a QST project, albeit
>probably not as easy as a QRP rig?

Sure. I've seen a number of projects in QST that were far more complex than the GRAPES RF modem (whose baseband is at 10 meters). Note that the GRAPES modem implements MSK, but it isn't the only way to implement MSK, and other circuits could do so with fewer parts, and/or higher performance for HF usage. It is, after all, intended for high speed usage on the UHF spectrum via a transverter, but it does implement the necessary bandwidth conservation techniques, so it serves as an existance proof for the technique.

The transmit modulation generation is simple, but specifically how the demodulator is done ultimately defines the performance of the system. The GRAPES demodulator is done in hardware and optimized for 56 kbaud, so some changes would be required to work most effectively with low rate signals in the noisy HF environment, mainly changes to the IF filter and time constants in the Costas loop. Use of simple DSP would probably make the whole exercise trivial for the baud available at HF. At the time the GRAPES modem was designed, suitable inexpensive DSP chips weren't available to deal with 56 kb and so the design had to be implemented in hardware. That adds circuit complexity that could be eliminated by use of any one of several currently available DSP chips. The GRAPES design is 8 years old, and was intended to be simple, cheap, and easy to build with parts commonly available at the time.

However, the Lowfers have been using low rate codings implemented in hardware for a number of years with remarkable results. They're using effective bandwidths on the order of 0.01 Hz with nothing more elaborate than some opamps, tri-state analog switches, and TTL logic. The key to effective operation is clock synchronization. Once you have that,

correlated oversampling will quickly tighten the effective passband
and rapidly raise the effective SNR. Perhaps a word about this would
be useful. Assume data synchronized to some clock using a simple coding
scheme (a Manchester code in this case).



0 0 1 0 data

A transition of the signal on the falling edge of clock signifies
a 1, no transition on the falling edge of clock signifies a 0.
It doesn't matter which way the signal transitions, only the change
of state matters. The signal always transitions on the rising edge
of clock, thus embedding clock into the signal.

Now if we recover this signal and sample it with a 1X clock, we'll
be looking for the transition on the falling clock edge to determine
if we have a 1 or 0. To resolve that we have to have a fairly high
bandwidth, something on the order of 3X to 5X the clock rate or greater,
otherwise the edges of the signal will be smeared and rounded by the
IF filter and prevent a clear decision. This is undesirable since
it limits the achievable SNR. Adaptive slicers can help a little,
especially for signals that are slewed, but not much.

However, suppose we sample with a high multiple of the clock rate,
say 16x, then we have 8 samples before the suspected transition
and 8 after. If we accumulate these samples and compare their
sums at the end of the bit period, we'll have effectively narrowed
our bandwidth to 1/8th it's previous value with respect to short
duration noise, and we can now use a narrower analog filter with a
bandwidth on the order of 2X clock since a sharp edge is no longer
required to pass in order for the 1 or 0 decision to be made cleanly.

With an even higher oversampling clock, we increase our effective
SNR even more. Now this assumes that the sample time is on the order
of, or less than, the average noise hit. To assure that, we may
have to lower our data rate so that the symbols are long with respect
to noise pulses. But we don't have to narrow the analog filters in
our radio by the same amount to gain the SNR advantage. The sample
and accumulate process has the effect of narrowing the bandwidth
with respect to noise.

Now the GRAPES MSK modem doesn't use this technique, but the Lowfer
system does. It's a fairly powerful technique for low rate signals
that's easy to implement in hardware (it's basically the principle

of a switched capacitor filter, but with the added feature of having
the sample clock locked coherently with the desired signal, and that's
a major improvement). Now, we can extend this same method, or better ones,
there are much better ones, to individual RF cycles if we have sufficient
hardware speed to deal with the high sample clock. Now we have a powerful
technique indeed for separating coherent signals from incoherent noise. The
coherent samples add constructively, but the random noise does not, IE a
rising edge always increments over a series of samples, but the amplitude
of incoherent noise may go down as likely as it goes up at any sample
because of it's statistical nature. Thus it tends to sum to zero, or a
constant bias, over a large number of samples. Foreknowledge of the
phase of the desired signal is one of the most powerful techniques for
separating desired coherent signals from a chaotic channel. It's the
basis for the astounding weak signal performance of the NASA DSN.

>There must be some problem here i don't get, such as it's in a mode

Clover is an existance proof that modulations other than simple FSK
are allowed on HF. It's perhaps more complex than necessary because
it has to work through ordinary analog SSB radios which are very far
from optimized for digital transmission, but the fact that it exists,
and is permissible under the rules, is ample proof that we can use
other modulations for digital data at HF than crude FSK.

By and large, amateurs haven't used more advanced digital modulation
techniques on HF because (a) they don't know about them, (b) they
think they are too complex or difficult to understand, (c) they
believe (falsely) that they are illegal, (d) they're so brainwashed
into the manual Morse and analog voice paradigms of communications
that they reject out of hand better digital methods, and (e) there
have been no commercial Japanese products implementing the techniques
for amateurs to purchase.

As for the GRAPES RF modem, its details were explained throughly
by Dale Heatherington (its designer) in one of the ARRL Computer
Network Conference Proceedings. Look for a paper on the WA4DSY
modem if you want to know more. Again I would note that this serves
merely as an existance proof for the technique. Alternate implementations
optimized for low rate signals would serve better for HF operations.

Well, "don't encourage them" is usually a good practice in those
situations, but that's not what the FCC regs require. The FCC regs
are concerned about *direct* contacts. When you get into relayed
connumications, the situation changes a bit. For example, your
interpretation of the regulations would consider use of a repeater
phone patch to talk to a non-amateur as illegal. It isn't, at least
generally. As long as the station you are in *direct* RF contact
with is a legal amateur station, any communications you exchange
through that other station is not non-amateur *to you*. The
station handling the communications may have concerns if he's
relaying non-amateur traffic, but you don't. The FCC regulations
are only concerned that the stations with which you *directly*
exchange RF are legal amateur stations. Third party *content*
faces another set of regulations, but as long as that third
party content isn't obscene or business related the FCC isn't
interested in that either.

>then how am i supposed to tell what they are??

Well "tactical" calls aren't legal calls of course, no matter how
they are formed. However, the FCC doesn't require legal IDs except
at the end of a communications, or every 10 minutes if a communications
lasts longer than that. So in practice you can use anything you like
as such a "handle". Personally I don't like the idea, but it's not
illegal. If I read you right, however, you are saying that some stations
are using "handles" that mimic actual legal call signs. Now that could
be a legal problem. The rules prohibit the transmission of false call
signs. Note that only the station actually claiming to *be* that false
call sign is violating the rules. Any properly identified amateur
station that merely relays those transmissions is not in jeoprady
unless some other third party content rules are being broken.

>If i'm a acting as a node (and i've been hacking in those directions),
>then i have another set of problems beyond the scope of this discussion.

Yes, absolutely. Now you're transfering third party content and have
to be sensitive to the rules regarding that content. As an amateur
you are always responsible for the content of anything you transmit,
of course, but you have to be specially careful of any third party
content you are relaying.

>following my instuctions as best as they can (which isn't always very
>good). At any rate, these are little details which obscure the question
>of what should be an address in an AX.25 packet.

Ah, no, Dxing is classically defined as exchanging RF from *your* station with a distant station. If you introduce a relay station, then it's *his* station's RF that is being exchanged with the distant station, you're just a relayed third party to the process. For example, suppose you're sitting in your living room with your little HT chatting on the local repeater station and a big bad Dx call appears because of a band opening. If you work that station through the repeater station, *you* aren't working Dx, the repeater trustee's station is. You're just continuing to exchange RF with the local repeater station. You'd only be considered working Dx if your little HT signal reached the Dx station *direct*.

The same thing is true with digital relaying. Only direct exchanges of RF between stations count as Dx. Everything else is only what one or more of the stations in the *network* are doing. To the FCC, and to Dxers, the only thing that counts is the RF exchanged *directly* between two stations. In both cases that's counted as an amateur contact if both the stations doing the RF exchange are licensed in the amateur service. Relayed communications is not considered a contact, rather it is considered some form of third party communications. This applies both to FCC regulations, and Dx contest scoring.

That's why I said all your contacts are *local*. They are only exchanges of RF with your local network node. Everything beyond that entry point is simply relayed third party content. It's the responsibility of the *network* stations, not of your station. You neither need to know or care what happens out there in the network cloud. That's the network's responsibility, not yours. All you need to be concerned with is the RF your station directly exchange with another amateur station. That's the contact as far as the FCC or Dxers are concerned. All else is third party content.

Now you might be *interested* in what's happening out there in the network. You might be *curious* about where stations are entering the network. That's a different topic. Now you are leaving the realms of legal responsibility and contest scoring and simply satisfying a personal urge to know. That's fine, and I'd agree that bogus "handles" instead of legal call signs on the network stations can be an irritation in that respect. But you should just consider it part of the personal challenge of exploring the network to find out what the real call signs are of such relay stations. If they are operating legally, they have to transmit them at least every 10 minutes, so patience may be rewarded. Of course they *could* be transmitting their legal call signs in Morse, that's permitted, so unless you are in direct RF range you may never know the true identity of some of them because the network isn't going to relay Morse.

There's one called Orbitrak. I've used it and it seems pretty good. Don't remember where I got it, but I know I've seen it via ftp. Poss on ftp.ucsd.edu, somewhere in the hamradio subdir.

MICROWAVE SYSTEM COMPLETE FOR SALE

San/Bar 12 gig Digital microwave with redundant transmitter and recever. IncludesI LeeMah status monitor systerm, dryer one side. Two antennas with covers appx 6 ft dia with covers and mounting hardware. Was in working condition when it was took out of service 9 months ago. Will require new wave guide to an from antenna flexible., There is a back up battery system but it would be cost prohibitive to ship. I believe all the manuals are intact with schematics. This unit was use for a 50 pair telephone cable system but has many other uses (ie closed data trans . video)
Intro: the DMR is a quadriphase modulated transmission system which can 0perate in several bands from 7.125 to 19.04 Ghz. The units are modularized for quick part replacement in the field. Racks are included If interested I will fax more specs. SERIOUS INQUIRES ONLY. WILL CONSIDER ANY AND ALL OFFERS. FAX 907 532 2602 USA. Can ship world wide via sea & surface

Hello one and ALL (whoever he is),

Does anybody know of a program a person can use to filter out selected messages? That is to say, some program which will look for a particular string in a selected segment of the message header and REMOVE them. Fastecho has a method to Carbon Copy messages to another area, but frankly (like others) six messages asking all to 'subscribe' or 'message not deliverable' is a bit much.

>then how am i supposed to tell what they are??

Well "tactical" calls aren't legal calls of course, no matter how
they are formed. However, the FCC doesn't require legal IDs except
at the end of a communications, or every 10 minutes if a communications
lasts longer than that. So in practice you can use anything you like
as such a "handle". Personally I don't like the idea, but it's not
illegal. ...

Well, i'm just trying to describe what occurs in AX.25 headers which don't
correspond to legitimate callsigns, but generally refer to shared resources
(and occasionally personal machines). I don't know whether what they ought
to be called, whether they're tactical calls, handles, or whatever. At any
rate, these machines generally beacon every ten minutes, assuming they've
transmitted during that time, as required by Part 97. However, these cannot
always be heard, and in the presence of alot of traffic, i've seen as much
as an hour go by without seeing an ID for a given station. That is not to
say that i wouldn't be able to copy these beacons if i were reasonably

close to said station.

... If I read you right, however, you are saying that some stations
are using "handles" that mimic actual legal call signs. Now that could
be a legal problem. The rules prohibit the transmission of false call
signs. Note that only the station actually claiming to *be* that false
call sign is violating the rules. Any properly identified amateur
station that merely relays those transmissions is not in jeoprady
unless some other third party content rules are being broken.

That is correct. Apparently, they are intentionally using things that look
like actual call signs, albeit, not U.S. calls, in order to get around
shortcomings and/or restrictions in local NETROM-compatible nodes. More
specifically, some of these nodes appear to be unwilling to connect with
stations that do no use NETROM conventions or have legitimate-looking call
signs.

Now, if they had come up with things that fooled the software but not
the humans, for example, OAK6ND, then i would have said to myself, "oh,
that's wierd", and looked the other way... Lowfer's aren't supposed to
use their amateur call signs, and i understand their convension is to use
their call sign suffix instead. If the locals were to follow a comparable
convention to identify their KA ("Wild") nodes that would still get around
their software troubles, this wouldn't be an issue for me.

The same thing is true with digital relaying. Only direct exchanges
of RF between stations count as Dx. Everything else is only what one
or more of the stations in the *network* are doing. To the FCC, and
to Dxers, the only thing that counts is the RF exchanged *directly*
between two stations. In both cases that's counted as an amateur contact
if both the stations doing the RF exchange are licensed in the amateur
service. Relayed communications is not considered a contact, rather it
is considered some form of third party communications. This applies both
to FCC regulations, and Dx contest scoring.

I agree that's the case during most contests, but please read the Field Day
rules carefully. In their case, the "repeater" rule is waived for packet
and thus, if i read it correctly, contacts using digipeaters and nodes are
counted for Field Day.

Now you might be *interested* in what's happening out there
in the network. You might be *curious* about where stations
are entering the network. That's a different topic. Now you
are leaving the realms of legal responsibility and contest
scoring and simply satisfying a personal urge to know. That's
fine, and I'd agree that bogus "handles" instead of legal
call signs on the network stations can be an irritation in that
respect. But you should just consider it part of the personal
challenge of exploring the network to find out what the real
call signs are of such relay stations. If they are operating
legally, they have to transmit them at least every 10 minutes,
so patience may be rewarded. Of course they *could* be transmitting

their legal call signs in Morse, that's permitted, so unless
you are in direct RF range you may never know the true identity
of some of them because the network isn't going to relay Morse.

Packet is quite a different kettle of fish than CW, and not all of
those concepts may necesarily translate. For example, in our locally
congested RF enviroment, i may only be able to copy one out of six
transmission for such a station. That's not enough to preclude making
contact, particularly if i ask a node or digipeater to help me, but it
is enough not to see the ID packets for quite some time.

But, besides some, there are motivations other than contesting for
making distant contacts. We're out there experimenting, we're trying
out new ideas, pushing the technology (even if it is how much can you
get out of N transistors and not much power) and, hopefully, having a
good time. We also learn to improvise and communicate in an challenging
and often adverse environment, skills valuable to have in an emergency.

The way i read it when i finally got the change to get my license, we
are supposed to be taking pride in our call signs, as they are unique
to us, unlike our first names or other things we use informally on the
air. Many of us don't have great memories for such things, but i also
definitely got the impression that *not* knowing the call of someone
you're talking with more than briefly is not considered good form in
amateur radio.

I don't favor digital squelch. When there are more 'speeds' on the same
freq (2k4 - 4k8 - 9k6) the squelch only hears his own speed and ignores
the others. Many collisions occur then. Analog squelch is non-selective
and waites until the freq is clear.

This is something I'd like to experiment with if I ever have time. It would
be nice to have even a low-rate cross-state channel that doesn't depend on a
lot of hops, and is generally available regardless of band conditions. VHF
packet radio standards, at present, are intended for local coverage. The 1200
baud AFSK packet definitely leaves a lot to be desired for weak signal work.

>

>that are tolerant of mid-symbol dropouts, to get good results.
>
I'm not quite sure if I follow this. First the troposcatter path is long
and probably lossy (except for rare times when the band "opens"), so even
without multipath the received signal could be quite weak. This fact alone
would limit the maximum baud rate, as a certain "energy per bit" is required.
Multipath would cause two effects:
- Periodic carrier fading
- Distortion of symbols and intersymbol interference
Intersymbol interference would be a real disaster to existing FSK packet
equipment as it is not designed to handle it at all. For reference, since
radio travels 3E8 m/sec, 1/9600 sec = 31.25 km. So if a second path exists
which is 31.25 km longer than the first path, the data arriving over the
second path will be delayed by one symbol as it collides with the previous
bits (or symbols, with ordinary FSK) at the receiver. Actually, the received
data would be useless for the simple receiver at only 1/4 symbol or so delay.
To be honest, I don't know what kind of path length differences there are in
troposcatter. But that's the important thing to look at to see how much
intersymbol interfernce will occur. Receivers with adaptive equalizers will
be required if intersymbol interference is likely at the symbol rate chosen.
The second problem, periodic fading, does set a limit on minimum data rate.
Assuming that fades will always obliterate at least one symbol (and it would
be VERY slow indeed to ensure that that doesn't happen), then the problem is
using a rate fast enough to have a reasonable chance of getting a whole
packet through inbetween fades. (AX.25 will reject all packets that contain

one error, and most that contain more than one error. The rare ones that aren't rejected still contain errors.) There are several ways to do that:
1. Increase power so the signal fades below the minimum useable power less often.
2. Increase the data rate so the packet is transmitted in less time.
3. Shorten the length of packets to lessen the chance that a fade occurs during a packet.
4. Add error correction to the packets so packets with some data missing can be recovered.

There are obvious limits to #1 and #2. #4 is the obvious choice, and hopefully that is where packet is going, as it would help out even on local links. For speedy implementation with existing equipment, #3 is the only viable one. I should also note that AX.25 is not well suited to handle a sequence of short packets transmitted in a single burst. If MAXFRAME 4 is used for example, and the sender sends packets 1234, but the receiver receives only 234, it will ask for packet 1 again without acknowledging 2, 3, and 4, even though they were properly received. Most receiver software, especially if it follows the protocol exactly, will throw away packets 2, 3, and 4 until 1 has been received first. So the sender has to send all 4 over again, even though only one was lost in transmission. I suppose this is necessary to allow maxframe to be set to more than half the maximum packet sequence number, and avoid losing (without noticing) a whole sequence of 8 packets.

Another topic worth consideration is diversity. Since the tropo stations are likely to be stationary and few in number (that's the whole point, right, to establish long-range "wormhole" links?), some additional complexity and cost could be considered. Transmit diversity means transmitting the same data, at the same time, on more than one frequency, with the assumption that both channels are not likely to fade at the same time. This would probably not be real popular with "old-line" frequency coordinators, and seems to offer little advantage over receive diversity, where more than one receiver is used at different locations (only several feet apart will be enough at VHF) to simultaneoulsy receive the same signal, through different paths. Each receiver would demodulate the signal, then some sort of logic would make a decision on a bit by bit basis which received data is correct. This could be as simple as comparing the signal strengths at each receiver like is done in analog voice systems, to more complicated schemes that determine the "quality" of the signal from each receiver.

>A detector that oversamples across the bit period, not just doing
>a single sample at bit center, will work best.

>Gary

This is plausibe if the fading is rapid (fade duration < 1 bit), likely to happen only in mobile situations. But if the demodulator can "see" a notch out of the center of a bit, the filters in the receiver are way too wide for the bit rate being used. If slow fading occurs, then the whole bit will be gone no matter when it is sampled. For weak, noisy signals, an integrator type of processing could be used, maybe that is what Gary means, rather than

just comparing the receiver output to a decision threshold several times and recording the 'oversampled' bits.
What is more likely to be useful is a detector that remembers previous levels and attempts to subtract out intersymbol interference, i.e. an equalizer. The demodulator would probably need to be a linear I&Q synchronous demodulator rather than the common frequency discriminator, as when multipath hits one of those, the result seems to be very unpredictable.

As a developer of packet modems, this is very interesting to me. I would like to see some new standards emerge from this, as ordinary packet equipment and protocols seem poorly suited to this type of operation.

It depends on which version of PMNOS he's running - I was trying to run 1.1 (I'm not too sure if the major version is correct, but the minor one is) until I just got 1.2. It seems PMNOS
prefers it's control files to be in the root directory - under the DOS version, I ran everything
from a NOS subdirectory, and used the SUBST command to make it the root, but as OS/2 doesn't support SUBST (someone prove me wrong here, please) the AUTOEXEC.NOS and all the other control files require to be in the root directory. I haven't tried running 1.2 yet,
so I don't know if this little quirk has been amended.

John.

I have decided it time to start explore the digital aspects of hamming
and will be purchasing my first TNC shortly.

I would like to run TCP/IP and it is my understanding that one needs
NOS (Network Operating System). How does one attain this??

Also, Heard there was another one out there called JNOS. Looking for
opinions on both. i.e. which is best,which is the one everyone has, etc

Thanks,
Andy Cropley

I am looking for an FFT processor chip.

I know of one chip, the TRW TMC2310, from the 1991 TRW LSI Products Databook.

This chip performs up to 1024 point FFTs and uses external memory for array storage. I would like to find a chip that will do an 8K FFT with internal array storage.

Has anyone heard of such a chip, or at least other manufacturers that make chips similar to the TMC2310?

Thanks,

Andrew L. Sybrandy

Yeah, or they could use their actual legal call signs. That'd solve
the "problem" too. I don't know which is worse, network software that
won't allow arbitrary network node tags, or amateurs who refuse to use
their unique call sign as a tag. (If an amateur has several nodes,
the call sign would no longer serve as a unique network node tag,
but that's one of the reasons SSIDs were added to the protocol.)

Field Day is *not* a contest. Field Day is supposed to be an emergency
preparedness exercise. It says so right in the ARRL literature. :-)
Sure, I know, amateurs treat it as a contest, but that's a different
subject.

> Now you might be *interested* in what's happening out there

>contact, particularly if i ask a node or digipeater to help me, but it
>is enough not to see the ID packets for quite some time.

CW IDs are not only legal here, they are *required* in some foreign
jurisdictions. What they put in the node tag field of the packet
doesn't count for legal identification, so they have no need to use
something that can't be confused for a call sign. I'm not saying its
desirable that they put something that looks like a call sign in
the address field, but in those cases their administration won't
mistake it for a call sign since it isn't a legal ID under their
rules anyway.

>But, besides some, there are motivations other than contesting for
>making distant contacts. We're out there experimenting, we're trying
>out new ideas, pushing the technology (even if it is how much can you
>get out of N transistors and not much power) and, hopefully, having a
>good time. We also learn to improvise and communicate in an challenging
>and often adverse environment, skills valuable to have in an emergency.

Sure, absolutely, I agree completely. Packet isn't about Dxing. Its
about communicating and experimenting. I was just trying to push
the paradigm that it's the network that's doing the work, not you.

Now if you are a network maintainer, a network builder, or a network experimenter, that's different. But as a network *user*, what happens inside the network cloud shouldn't be a concern. The ideal network would be totally transparent to the user.

>The way i read it when i finally got the change to get my license, we
>are supposed to be taking pride in our call signs, as they are unique
>to us, unlike our first names or other things we use informally on the
>air. Many of us don't have great memories for such things, but i also
>definitely got the impression that *not* knowing the call of someone
>you're talking with more than briefly is not considered good form in
>amateur radio.

Historically, amateurs have tended, if anything, to *overuse* their call signs on the air. Part of this may reflect pride, but a good part is just a carryover from a past when regulations required more use of call signs, and when operating practices (roundtable operation) often meant that if you didn't give your call (and the call of the stations with which you were in contact) at the beginning and end of every transmission you might not get the opportunity to meet the legal minimum ID requirement because it might be too long before your turn to transmit again.

Those days are gone. We no longer have to give the call of the other stations in the QSO at all, except during international third party traffic handling, and we only have to give our call sign at the end of our contacts (unless they last for more than 10 minutes, in which case we have to ID every 10 minutes during the contact as well). So using call signs frequently is no longer necessary, and they do add unnecessary overhead unless they serve some other purpose, such as doubling as a network tag in packet.

The only reason we over-ID today is just habit learned when the rules were different. That habit has been passed on to newer operators so that it's become sort of a tradition.

Gary

If in the Settings page for the OS/2 icon you set up to start PMNOS under the Parameters section
put the following: -d\tcpip ae_pmnos
The -d tells pmnos what directory the files are located. The ae_pmnos tells
pmnos the name of the autoexec.nos file that you use. My autoexec.nos file is
named ae_pmnos and I have it in my c:\tcpip directory.

2416. The NOS Family

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-06 00:00:00 UTC
From: gareth@lightfox.demon.co.uk
Message-ID: <19950605.232615.24@lightfox.demon.co.uk>
Source record: 43052

I've just seen a posting by Andy Cropley who wishes to run NOS, and enquiring about the suitability of JNOS too.

The following is a personal opinion and doubtless some gurus may wish to publicly fight a corner, or hopefully enlighten us more about the capabilities of the NOS flavours !

If I havn't mentioned your NOS here, sorry - please let us know !

NOS by KA9Q (Phil Karn) is the Great Grand-Daddy of them all. Derived from NET (the great-great Grandad - which can still be found in an Acorn Archimedes version). The original by the Master.

PA0GRI is a Grandad. Appears in the form NOS_00.a where the `00' and the `a' make up the release number. Documentation for PA0GRI is often a lot easier to understand than for some modern versions, and is often just as valid too !

G1EMM is another `grandad' NOS. Parts of G1EMM's code have found their way into other NOS's too.

WNOS (by WAMPES) In its day, respected for being one of the most stable. Contains a notorious auto-router that you will either love or hate. Still developed, but I think more for Linux than DOS (?) It lives a little way out from the family tree, and is more like a cousin if such a thing were possible, to GRI and EMM NOS.

JNOS (from WG7J NOS) is now a father NOS, and is still enthusiastically supported by a wide following, and under continual development still. JNOS was born of the need to make the `bbs' part more acceptable and usable by `vanilla' AX25 users. Interfaces well to the `plain' AX25 world. JNOS has perhaps the widest following of `modern' NOS's. Latest version is 1.10j

K2MF and WA3DSP both produce versions apparently based on an earlier JNOS around the time of 1.08. They are refined `super stable' derivatives designed for heavy duty use in network linchpin operations.

TNOS (Tampa NOS) Said to contain an enhanced BBS front end to attract AX25 users. Seems to be aimed at the Linux rather than DOS following.

UKNOS (G8FSL and G0MHD) seems based on JNOS 1.10i and is the latest newcomer. Should support the Baycom four port USCC card in open squelch radio situations. Enhanced NNTP gateway.

You may have learned to drive on a particular car, but you're probably driving a different one know, and may have gone through quite a few ! The skills required to drive the various members of the NOS family are the

same, but the indicator sticks are sometimes in different places, and
after changing you may hit the windscreen wash instead of the horn !!

Please bear in mind that the make-up of your chosen NOS will depend on
the options chosen in `config.h' during compile-time. Generally speaking,
NOS developers release a set of executables which they think people
will want. For maximum flexibility and choice its best to either get
a suitable compiler (and they vary !!) and the source code for your chosen
NOS or find someone who will roll one for you. A 386 compile of a NOS may
release as much as an extra 25k for the `core', but not all 386 versions
of NOS are stable - some 186 NOS's won't run on a 286 so be careful !

If you are new to NOS, and starting out, here's my best advice:

Use what your friends use !

Cheers,

Gareth.

2420. Re: The NOS Family

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-06 00:00:00 UTC
From: gareth@lightfox.demon.co.uk
Message-ID: <19950606.171648.02@lightfox.demon.co.uk>
Source record: 43056

Mike Chace has asked me to post this description of WNOS for
those interested in the family of NOS. It's perhaps fair to
point out that other NOS's may contain some special facilities
described here.

Many thanks for your description Mike,

Cheers,

Gareth.

<START OF ARTICLE>

WNOS was developed by DB3FL and was a hybrid of the popular WAMPES (that's
what the W in WNOS stands for) software for Unix and KA9Q NOS . I looked after
it in the UK and DC0HK (aka G8SAU) is now continuing development since Mike,
DB3FL seems to have given up.

It is a DOS-based NOS and has no connection with Linux. What makes it very
different from other NOS versions is primarily the user interface which
provides separate screens for each session, the command interpreter and
the trace screen. The user switches about each screen by hitting a
function key. Each session also shows the important session parameters on
a permanent status line at the top of each screen eg FTP shows bytes in or
out, AX.25 shows packets unacked, link delay time etc. The status line means
that you can instantly see the progress of your session without having to
type commands like "ax stat 02fe" (but also painfully reminds you how slow
our networks are :-)) Split screen is also supported so that you can key-in
outgoing text without it being lost in incoming stuff.

It isn't a distant cousin of KA9Q NOS. It's as far removed from the "vanilla"
code as any of the other NOS versions.

It's a shame that few people understand the autorouter, WNOS's other major
differentiator. It's very easy to understand -- either the IP one or the
one that works at the AX.25 level. After all, all it does is to automatically
maintain either the IP routing table or the AX.25 routing table, things which
most users are quite comfortable about (or perhaps they don't realise that there
is an "ax25 route" command in most NOS variants?). When used, it makes for a
system as useful to end-users as NET/ROM but without the overheads as it's all
hop-2-hop ack'ed at level 2. You can just type "connect g7xyz" and the
autorouter does the rest -- see how WNOS doesn't even need to know the
interface name!

Still, if you hate the autorouter, you can always switch it off!

I have a very well connected (internet T1) Linux box with a good ant and a radio/tnc.

How do I get a wormhole setup so the locals can packet to other areas?

I have used dos nos in the past. I am looking for an easy to setup linux version.

From: rsmith@internetmci.com
Message-ID: <3r08s8$jk2@news.internetmci.com>
Source record: 43060

Wondering if someone could help me out. Tryig to RUN JNOSi on COM 1 (4800) into a AEA PK12. My address is 44.36.8.55. I am having trouble - Using GRINOS I can do an AX25 connect but many lines are dropped. Using JNOS and an AX25 connect I see the XMT and DCD lights go off as the should for an AX.25 connect but nothing comes to the screen. Could someone be a real dear and post an example of their autoexec.nos file back to me - looking for something simple - all of the examples I have are for very complicated systems.

Thanks

That's what killfiles do in a standard usenet newsreader. I see you're on fidonet, and probably are using some program that runs under the Microsoft program loader (DOS). You should be able to hack what you need using the DOS versions of grep, awk, and sed, though doing it with a DOS version of perl might be easier. If you've got a Snobol IV interpreter on the system, you could write a trivial program to do it. I suppose you could even write a Microsoft Basic program to do it, but I wouldn't want to have to do that. :-(

Greetings all -

Savant is still available from Sigma Design Associates at P.O. Box 49085
Colorado Springs Colorado. We also have the PacketMac Modem and latest
version of SoftKiss. You can e-mail reply here or get us on Compuserve
at 70611,1340.

(Jim VanPerursem (author of Savant) got a "real" job with the wireless
division of Motorola and they forced him to stop doing work that might be a
conflict of interest, so he transfered the rights to Savant to Sigma.)

Troposcatter can have a high path loss (and a band opening wouldn't
be troposcatter, so we can ignore that case). The actual path loss
depends on a number of factors, but can range from not much more than
ordinary ducted path loss for a forward scatter path with favorable
weather conditions, up to a loss on the same order as EME for pure
side scatter.

Either high antenna "gain", or high power is required for good SNR.
High gain 6 meter arrays are very unwieldy, so you're looking at kW
class stations if the receiving setup doesn't implement fairly
advanced techniques. 6 meters is about the worst choice for a band
on which to do troposcatter. The microwave bands are much better
because high antenna gains can be achieved with much smaller antennas,
and because the wavelength more closely matches the most common
scattering objects.

>To be honest, I don't know what kind of path length differences there are in
>troposcatter. But that's the important thing to look at to see how much
>intersymbol interfernce will occur.

Actually, troposcatter is Rayleigh scattering from non-specular
convective cells, dust, or water droplets. At 6 meters, it's
primarily convective cells doing the work since the wavelength
is too large to make effective use of the other mechanisms.

The path length differences are on the order of meters to 100s of meters, but they are the sum of *many* different paths, each varying by meters from another. The common volumes of atmosphere shared by transmitting and receiving antenna lobes determine how many (along with the weather). Smaller common volumes will reduce the number of multiple paths, and reduce their length differences. This implies very high gain antennas with their very narrow lobes will be best.

>>A detector that oversamples across the bit period, not just doing
>>a single sample at bit center, will work best.

>This is plausibe if the fading is rapid (fade duration < 1 bit), likely to
>happen only in mobile situations.

No, the convective cells that do the scattering "boil". This is the primary factor setting the rate of change of the multipath. The more turbulent the air, the better the cells are at scattering the signal, but also the more rapid the changes in path lengths.

>But if the demodulator can "see" a notch

>gone no matter when it is sampled. For weak, noisy signals, an integrator
>type of processing could be used, maybe that is what Gary means, rather than
>just comparing the receiver output to a decision threshold several times and
>recording the 'oversampled' bits.

Correct. Coherent oversampling with integration is exactly what I meant. Binning and weighting techniques would be applied before summation, and intelligence could be applied to discard obvious deviations from predicted signals, IE signal "holes" and noise "spikes" on the same order as the sampling pulse duration. This intelligence would need to be adaptive to the changing conditions of the common volume of atmosphere.

>What is more likely to be useful is a detector that remembers previous levels
>and attempts to subtract out intersymbol interference, i.e. an equalizer. The
>demodulator would probably need to be a linear I&Q synchronous demodulator
>rather than the common frequency discriminator, as when multipath hits one of
>those, the result seems to be very unpredictable.

Yes, but.... The problem with using ordinary equalizers is the rapid change in the signal path. When ordinary EQ is forced to vary at a rate on the same order as the symbol duration, it ceases to be very useful. It can never "train" to the average signal conditions. The binning and weighting I suggest above would accomplish much the same thing in sample duration "realtime".

>As a developer of packet modems, this is very interesting to me. I would like
>to see some new standards emerge from this, as ordinary packet equipment and
>protocols seem poorly suited to this type of operation.

It would be an interesting challenge. As I said, I suspect 6 meters is about the worst band that could be chosen for this type of operation though. 6 meters would be best suited to *meteor scatter*, and in fact

spectrum just below the 6 meter amateur band is used to transmit hydrological data by meteor scatter for the government. The advantage of meteor "scatter" is that it isn't really a scatter mode at all. Rather it is the same sort of refraction that happens in the E-layer, but from the transitory ionized trails of meteors. Signal levels are strong, the best antennas have a main lobe width on the order of 60 degrees to intercept the widest common volume so the fewest meteor trails are missed, IE modest antennas, and power levels can be on the order of 100 watts or less. Suitable meteors arrive in the common volume at the rate of several per minute, and individual trails last on the order of seconds. So, this is mainly a protocol problem. We need fast pings to find a trail, then rapidly transmit one or more packets, then go back to pinging for the next trail. Since SNR is good during a reflection, heavily overloaded symbols can be used to boost effective throughput.

Gary

You are talking about different things. I think Clark was referring to the "Digital Private Line" system used by Motorola to share analog FM radio channels. Unlike analog PL, which has 36 tone frequencies, digital PL uses 512 digital codes. The code is sent continuously at a low baud rate (80 baud?) in the 0-300 HZ band under the voice modulation. I think it is some sort of Golay code, as Dr. Golay worked for Motorola for a while. But that's about all I know about it, I've never seen it work. I'd like to learn more about it. Maybe sometime I'll get some surplus equipment in here and reverse engineer it. I don't think Motorola ever made all the details public. Did any other manufacturers use a similar or compatible scheme?

As for digital "squelch" (DCD) on packet, my objection to Aart's theory starts with "when there are more "speeds" on one channel..." This is just a bad idea to begin with, analog or digital DCD. All stations on a channel should be able to intercommunicate for best results. The only reason (and unfortuantely it's often a valid one) to have more than one speed on a channel is politics. Using digital DCD is clearly better on a single-speed channel, especially for the remotely located nodes, as a misadjusted squelch control or the slightest amount of intermod or QRM can hold the squelch open and make the node

unuseable.

Subject: Wiring KPC-3 to Radio?

>>...KPC-3, and I'm getting ready to wire up
>>the connections to my radio (the much-maligned HTX-202).

The vast majority of HTX-202s are quite solid performers.

Here's the TNC hook up for the Radio Shack 2m HT:

```
TNC Radio
=== =====

Audio Out -----------||-------------- Tip of Mic plug
C1 |
|
PTT Line ----\/\/\/--------| Ring of Mic (not connected)
R1

Audio In --------------------------- Tip of speaker plug

Ground ---------------------------- Ring of Speaker plug

C1 is a 0.1 mfd capacitor of any type, R1 is 2200 ohms.
```

Gawd, Dan...I do not remember changing any jumpers in my KPC-3 to enable
use with my HTX-202. Someone else here is going to know for you!

Wnos is not Wampes.

Wampes is a kind of nos for Linux,
Wnos is a classical Nos for Dos (and others), which contains advantages of other nos systems. (Some Ka9q, some Wampes and some selfwritten parts)
It's a pitty, that Wnos is not longer developed (the author had resigned from ampr). Some persons out of his team are continued his work. (One programmed for Linux).

First, see if you're getting a useable signal out of the radio by connecting an oscilloscope to the "audio" line from the radio to the TNC, which needs to come from somewhere other than the speaker jack, of course. I'm not familiar with the 231, so these instructions are unfortuantely somewhat generic.

Even one of those old 5 MHz bandwidth scopes will work for this, although triggered sweep is nice. A good 9600 baud packet signal looks like a series of overlapping sine waves (the frequency of the sine waves is 4800 Hz) A bad signal looks, well, NOT like a series of overlapping sine waves. The important feature to look for is open 'eyes' under the peaks of the sine waves. The space inside these eyes is the margin your TNC has to decide if the bits are ones or zeros. Having the operator of the station you're trying to decode put it into "calibrate" mode will make it a lot easier to see the signal, as a carrier will then be present continuously for several seconds. The radio may be off frequency, or maybe it's just not getting enough RF into it and you need to move the antenna slightly. If the radio is off frequency, the tops or bottoms of the pattern will be distorted. If there's not enough signal, then you'll just see noise all the time. If the signal looks good (and probably it doesn't) then maybe it's the wrong level for the TNC, or something else TNC-related is not right. Those are unlikely though, since it passed the loopback test.

Source record: 43074
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.digital.misc

I am in the process of putting together a new HAM 'shack', and I have
come across an interesting 'snag'.

I have heard, many times before, to be sure the HAM radio ground is NOT
grounded to the house wiring ground system. Various explanations follow,
usually to avoid having the house wiring turn into a massive antenna.

Anyways, I was SURE to separate the two and overlooked one point . . .
packet ! My TNC uses a serial cable, connected to my computer, which in
turn has a grounded chassis! Argh! To top it all off, the serial cable
is NOT the right way to ground to a 'secondary' ground. Talk about a
'high' resistance path to ground, forming an 'ideal' ground loop!!!!

My question is, "How can I avoid this, and if I cannot, what effect will
grounding to the house ground REALLY have?" "What are my OTHER options?"

Thanks for your replies in advance,
Jeff

>is that a matter of convenience, or is it a hardware problem?

Neither. It's a matter of the concept of the role of the network.
The network's role is to accept requests to forward traffic to a
specific destination address. The Morse ID doesn't make a forwarding
request, nor does it supply a destination address. Where would you
suggest the network forward the Morse ID? Perhaps to enforcement@fcc.gov?

You don't want the network relaying *all* local RF activity across
the network. First, because it would overload the network trunks,
and second, because most local traffic has a local destination. In
the case of Morse IDs, they have no meaning outside their local
RF domain where they can be associated with the RF carrier they
are identifying.

Gary

Hi Bob,

It's my understanding, from the experiences of a local IP'er that you
have to turn off a command in the PK-12 before it will do KISS properly.

I beleive the command is ALFDisp. Otherwise any time the TNC receives a
packet containing a carriage return (whether part of the data or headers)
it inserts a linefeed right after the carriage return.

This was something AEA solved many years ago on the Z80-based TNCs, but
the new programmer is still learning what has to be done for packet to
work smoothly in all of it's many varied forms.

Hope that helps!

73, Bob (ex AEA tech support)

2443. KPC-9612 <-> Kenwood TM-733

Hi,

Can someone help me with the connection between a Kantronics KPC-9612 and
a Kenwood TM-733?
I want to use it on 1200 and 9600 baud.
The version of the KPC-9612 firmware is 5.2. Is there an update available?

The J2 option is an alternate to the wiring with the cap and resistor.
I wired mine just like the HT diagram and did not mess with J2 jumper.
You do have to jumper the cap and resistor in mid air, but it does work.

>
I have not tried it but I do not see any reason you can't connect
to your phone modem instead of the tnc. As I understand it you do
not use the tnc firmware in KISS mode and you set the tnc to KISS
to run nos.

2447. Anybody know about the old HP Portable Plus laptops?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-07 00:00:00 UTC
From: philkeys@olympus.net
Message-ID: <philkeys-0706951622410001@ptpm020.olympus.net>
Source record: 43083
Cross-posted to: comp.sys.laptops,rec.radio.amateur.digital.misc

Does anybody know about the old HP Portable Plus laptops? I recently acquired two of them: DOS 2.11, no floppy, no hard drive, HP IL port (apparently an obscure HP daisy chain interface bus), DOS and various applications in ROM, memory divided between working storage and a RAM disk. The battery always keeps the memory alive. The On/Off just controls the display.

I have been trying to find a way to download some sofware but am frustrated so far. The TERMinal application program does text transfer but no binary transfer. I do have the HP IL running between the two laptops so that one can access the RAM disk of the other. There is no BASIC interpreter. There was an HP floppy drive that attached to the HP IL daisy chain but I don't have it.

Anybody got any ideas how I can download software?

Does anybody know about the applications in ROM; HP Reflection, VT Reflection, ECM, Advance Mail, Transfer Mail, Time Management?

Thanks for any help you can give me.

This is a potentially dangerous situation. If your amateur gear is totally isolated from AC ground, there couild be a significant difference in voltage potential between the chassis and AC ground. Under these conditions, simultaneously contacting the chassis of the rig and any AC grounded device would place you in the current path.

>usually to avoid having the house wiring turn into a massive antenna.

This will only happen if the feedline radiates due to an improper antenna installation. If this is the case, adding the AC ground as a radiating element probably won't predictably deteriorate your signal any more than the radiating feeder.

>Anyways, I was SURE to separate the two and overlooked one point . . .

Ground all nearby "appliances" together, including the rig. This will avoid the risk of electrical shock and will also serve to reduce the liklihood of ground loops.

Like many folk tales, while there is a grain of truth to this idea in
some *very* special circumstances, it's generally false, not to mention
being a violation of the National Electrical Code.

>
>My question is, "How can I avoid this, and if I cannot, what effect will
>grounding to the house ground REALLY have?" "What are my OTHER options?"

Ok, this isn't a simple issue, or a single issue. There are several
related concepts and factors involved. Bear with me and I'll try to
touch on most of them.

There are three general reasons given for grounding a station.

1. Improved RF performance.
2. Elimination of stray RF in the shack.
3. Electrical safety.

Of these three reasons, only the latter has merit except under
special conditions. Lets look at them one by one and see where
the truth lies.

1. Improved RF performance.

This is usually a reason claimed for needing a good ground. It is
actually false except with antennas that must work against ground,
and even then the ground needs to be at the antenna feedpoint and
not at the transmitter (unless the transmitter *is* the feedpoint,
as can be true with some random longwire antennas). A balanced antenna,
such as a dipole, yagi, quad, etc, is ground independent. It does not
need a ground connection to work, and will in fact work in free space
with no ground connection present at all. Many verticals, longwires,
and some other asymmetric designs need to work against a ground reference.

That ground reference, however, doesn't necessarily need to be a connection to Earth. A counterpoise, radials, or the like can serve just as well, or better, than an Earth connection. And that connection needs to be under the antenna, and not back at the shack.

2. Elimination of stray RF in the shack.

This is often a reason given for a RF ground connection to Earth. However, this is like taking aspirn for a brain tumor. It may suppress the symptoms to some extent, but it doesn't address the real underlying problem. The real underlying problem is a station design or layout fault. If the equipment has poor Faraday shielding, or if the feeder currents aren't well balanced, or if station interconnections create daisy chains or ground loops, then there will be stray RF in the shack. Grounding one or more cabinets may actually create more circulating currents which can *increase* the problems of stray RF. In some cases, attachment to a good RF ground will reduce stray RF problems at some frequency, but may increase problems at another frequency. This is not the proper approach to dealing with stray RF. The preferred approach is to eliminate the *cause* of the stray RF.

3. Electrical safety.

This is the *real* reason for an effective grounding system for the shack. There are two different hazards that an effective grounding system will solve. One is ordinary electrical shock hazards. In the US, the National Electrical Code is the standard that addresses this. One of the cardinal rules of the NEC is that *all ground connections must be bonded together*. If you fail to do this, you can have a shock hazard between cabinets connected to different ground references. So the myth that you need to keep utility and RF grounds separate is not only false, it can be a safety hazard. (There are a couple of *very* specialized circumstances where the Code permits isolated grounds, but as a general rule, failing to bond all grounds together is a major Code violation.)

The second reason for an effective grounding system is for lightning mitigation. This can be a difficult problem and must be approached with care. A single mistake can be very costly. Lightning is RF, and like any other RF, downlead inductance is a primary concern in setting up a grounding system. Lightning surges also represent peak currents on the order of 8,000 amperes (with ocasional so called "super bolts" going up to 200,000 amperes). These discharges only last for microseconds, so the average power is low, but the peak power is intense. It only takes a slight amount of inductance in a downlead to generate a potential difference of tens of thousands of volts between one end and the other. If these potentials are allowed to express themselves between equipment cabinets, devastating damage can occur to sensitive electronic components.

There are two concepts you must apply to your station ground system as your first lines of defense against these potentials occurring across your equipment. The first concept is that of a single point ground, and the second is called ground window technique.

Single point grounding is simple in concept, but often subtle in execution. Basically, all connections to Earth must be interconnected at a single common point, and all connections from equipment that needs a ground termination must run to that single point and to *no other connection with Earth*. Daisy chained connections are strictly prohibited. Every connection to the single point must be straight and direct from the equipment requiring the ground connection. Ground "busses" are a serious no-no despite their being touted in amateur literature. They form instant ground loops for the equipment, and at the high currents present in a lightning discharge, they can cause thousands of volts to express themselves across the various cabinets connected to the "ground" buss. Don't do this.

The idea here is that because everything is forced to a single potential, that of the single point, *whatever it is*, no current can flow through the equipment. Zero potential difference results in zero current flow. It's those damaging currents you are trying to control. You don't want the path *to* ground to be *through* any of your equipment. Rather, you want the path to ground to be through the single point, and only through the single point. Note well that "ground" is *not* zero volts, and will not *be* zero volts in any sense except a *relative* one during equipment operation or during a lightning strike. This doesn't matter if your layout topology is correct. All "ground" is supposed to be is a *common* potential for everything in the system to reference against. Use of a single point connection *enforces* this single common potential, whatever it may be at any given instant.

When you start thinking about the many "ground" potential interconnections in your station, achieving a true single point ground system seems a daunting task. This is where the related idea of a ground window can help. The purpose of the ground window is to *short out* any possible ground loops in your system at the station entry point.

A ground window is simple in concept, and simple in execution. Basically, it is a physically small conductive plate through which *every* cable that enters or leaves your station must pass. Every cable that is supposed to be at "ground" potential is bonded directly to this plate as it passes through. Every conductor that is not supposed to be at "ground" potential is bonded to the plate via an appropriate suppressor device. (A book could be written on that subject alone.) Then the plate is connected to your single point ground by a heavy low inductance strap conductor. Now any large potential

difference that tries to express itself across cables
connected to various cabinets in your shack will find itself
shorted out at the ground window.

Note carefully that *every* cable must pass through the ground
window plate on its way in or out of your shack. That includes
power, telco, CATV (if present), and any network wiring as
well as the usual antenna feeders, rotator control leads, etc.
If only *one* wire bypasses the ground window, the protection
it offers is lost. Don't run extension cords to power outlets
that don't pass through the ground window. It can cost you
everything you own in a strike, including your life.

Now since you've taken great pains to do this protective grounding
system right, you'll find that it makes an excellent general purpose
RF grounding system as well. This is not to say that you'll generally
need a general purpose RF ground for the shack if you've done your
homework on antenna feeds, Faraday shielding, and the like, but you'll
have one anyway. And if you've done the job right (which requires
attention to a level of detail I haven't fully addressed here), your
station will be able to work even during the worst thunderstorms,
and even during direct strikes, without damage or interruption.
Proper grounding is a specialized, but well understood, part of the
protective process that radio and television stations, commercial
and military two way, and *amateur* radio stations should understand
and apply.

There are two different version of xNOS that will compile and run on
Linux. The first was based on JNOS 1.09 but hasn't been updated much.
The latest is Brian Lantz's TNOS. I'm running/testing that right now
under the Linux 1.2.8 kernel. You can get TNOS/LINUX from ko4ks.ampr.org.
You can get more info on it via hhtp://www.lantz.com.

As for easy set up..... keep dreaming. If it was easy.... anyone could
do it. ;)

Try 14.065-14.085 for Amtor/Pactor and 14.080-14.090 for old-style RTTY in
the amateur bands. Likewise 7.065-7.085 or so for both. Digital is a
really fun way for hams to communicate on HF, although the crummy band
conditions lately haven't helped.

2458. Re: Digital squelch

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-08 00:00:00 UTC
From: tvr@cnmat.CNMAT.Berkeley.EDU
Message-ID: <TVR.95Jun7192129@cnmat.CNMAT.Berkeley.EDU>
Source record: 43094

You are talking about different things. I think Clark was referring to the "Digital Private Line" system used by Motorola to share analog FM radio channels. Unlike analog PL, which has 36 tone frequencies, digital PL uses 512 digital codes. The code is sent continuously at a low baud rate (80 baud?) in the 0-300 HZ band under the voice modulation. I think it is some sort of Golay code, as Dr. Golay worked for Motorola for a while. But that's about all I know about it, I've never seen it work. I'd like to learn more about it. Maybe sometime I'll get some surplus equipment in here and reverse engineer it. I don't think Motorola ever made all the details public. Did any other manufacturers use a similar or compatible scheme?

I believe what you will find in modern HT for digital squelch (DSQ) is based on DTMF ("Touch Tone") encoding, usually three codes to open squelch. Sometimes, this is used for access control to closed repeaters, and several manufacturer have used this to implement simple-minded paging schemes (which are usually do not interoperate). Most other repeaters use DTMF for control purposes, and suppress them on the output-side. So, in general, DSQ cannot be used by individuals for selective calling on non-simplex channels.

Now, more sophisticated repeater operators could, in principle, if their hardware supports multiple PL tones (and pass them to the output side), use a second PL to ignore DTMF for control purposes and allow them that also to go out on the output side. The regular users (if their rigs support it) listen using TSQ (tone squelch) for the main PL, and those only wanting to receive priority or directed traffic could use DSQ with the secondary PL. (Of course, you would have to turn both off prior to starting a QSO, or you'll likely step another user.) Then the regular users aren't bothered by loud DTMF signals (if their rig is TSQ capable and they know how to use it), and others can leave their rigs on in a work environment, knowing they won't be bothered (or bother others) with random chatter. Now, this is all fine in theory, and perhaps it might work for a sophisticated group of users, but i suspect it may just be too complex for most of our VHF/UHF users.

-- KD6PAG (networking old-timer, RF newbie)

P.S. I have a couple of manuals which describe how two HT manufacturers do simple-minded paging, and if there is sufficient interest, i can look this up.

2459. Re: How to get PK232mbx into KISS reliably for TCP/IP

Newsgroup: rec.radio.amateur.digital.misc

Source record: 43095

I am the user of a macintosh and am only guessing. I had MacRatt but it wouldn't work with sys. 7.1 and my powerbook. I was able to use a regular terminal program and work with the PK232. In the terminal program all I had to do was type kiss on and hit return and then I was in kiss mode. It would also display that after I hit return. You should be able to set it up in your autoexec file to have it turn on kiss mode. I am presently using a kantronics 9612. The param that I set up for it was:
param ax0 intf kiss
param ax0 reset
That way I am set into kiss mode with my autoexec file. 73 N9OUM

Ok, in addition to Digital PL, we also have "Code Squelch" based on DTMF.

On my Standard HTs, the Code Squelch (as they call it) is a sequence of 3
digits. With this mode engaged, the 3 digits are transmitted in a burst every
time the PTT button is pressed, and the receiver remains silent until the code
is received. Then I think the squelch reverts to normal carrier operation,
even if the signal drops for a few seconds, to allow for fading. If no
carrier is received for several seconds, the receiver is locked out again
until the code is received. It's quite a neat feature. Even sending the 3
digits by hand from a conventional keypad will work, so just about anyone can
call me, even if their radio is not equipped with a code-squelch feature.

>starting a QSO, or you'll likely step another user.)

There is a simpler way to do this. Make all the repeater commands start with
"*" or "#" (or even more sneakily, one of the top 4 tones). The repeater
would only mute tones after receiving one of these. Since the code-squelch
signals are all digits, they would pass through, but repeater commands would
be muted as usual.

Another approach would be requiring the second PL to send commands. Then the
repeater could be set up to not even key-up while it is receiving commands.
Anything sent with the normal PL would be repeated, not decoded, so the
unenlightened hacker who doesn't know what the secondary PL is wouldn't be
able to send commands at all.

Many of the repeaters around here don't use DTMF at all. So if there's one of those you can use, just blast away.

I'd like to see the paging manual sometime. I had the Standard paging figured out once, but don't remember it exactly now. Also there is a feature which allows the C178 to "wake up" from a deep standby condition by receiving a sequence of DTMF tones, even though the power switch is "off"

I don't really have any idea about the software (I use pc packratt :-), or Macs, but I can give you the wiring diagrams between the rig and the TNC. Are you sure it is not in the manual, or am I thinking of the technical reference manual (for the PK-88)?

Hi!

I recently got a software Macintosh Emulator for Amiga to work and
would like to know what (preferably freely distributable) Packet Radio
programs exists for the Macintosh, and where I can find them. I. e. I
am looking for hostmode software to work with a TNC2.

I know there must be such programs, and I'd be grateful, if anyone
could point me to it.

I'd very much prefer an ftp site, but a name of such a program will
do, then I can search for it.

I already looked at ftp.ucsd.edu, but couldn't find anything there.

Thanks,

Bernd

>There should be two separate grounds in the shack - one for the AC
>supply and one for RF.

Absolutely incorrect, unsafe and against standard practice. I wish you had stated your reference for this.

All grounds must be connected together with the shortest possible heavy wiring for safety reasons and to limit lightning damage. Read any book on "bonding" or lightning protection. Look at what the phone company does. They connect to house ground where the wires enter the house.

Look at the gadgets sold at Radio Shack. You plug in a gizmo that grounds the 75 Ohm TV lead to the AC outlet ground. Why, because it saves your TV from damage from nearby lightning.

In commercial mountain top RF installation, they put a big copper plate on the wall. On this plate they run RF feed throughs, tie a bus bar to the tower, mount all the AC outlets and connect the phone lines. Then they mount the RF equipment on an insulated stand. When lightning hits the tower, the whole plate jumps to 10,000 Volts but they get minimal voltage differences between RF, AC, phone, etc...thus preventing damage to the equipment.

>Now then comes the confusion, which equipment

So what do you suggest?...UL approval requires a green wire ground (the third pin on the plug to electrically connect to all metal surfaces not double insulated. Do you advocate removing the ground pin?

>Interconnecting the grounds may not be a problem in general and
>many times you can do it with no ill effects, but be aware that
>doing so can cause circulating currents in the whole ground
>system which will cause ground circuit noise (result of ground loops).

Connecting RF and AC ground systems may cause currents to flow but it will cut down on voltage differences. No harmfull effects come from ground loops...that's one of the great myths. The only case where multiple grounding systems becomes a problems occurs in low level audio when AC currents in a long mike cable can cause hum. But I simply suggest that you don't connect AC and RF grounds via the mike cord if you want to avoid that problem.

The person posting the original question reasoned that if one connected the rig and power grounds, then the power system would become part of the antenna. Well...since the house power wires probably fall into the RF field of the antenna, they will have RF voltages on them. If the RF environment of the house wiring and the rig case differ, then voltages and currents can flow between the mike and the lips. I never like RF burns from a mike and you probably won't either.

>Separate the grounds often and check for a voltage difference

If you do this, it makes the power supply the most likely thing to fail whenever a dark cloud passes overhead. You really want to connect your antenna grounds, tower, etc. directly to the Power AC ground.

There should be two separate grounds in the shack - one for the AC
supply and one for RF. Now then comes the confusion, which equipment
should be connected to what. For sure, all the RF output equipment
should go to the RF ground by a low impedance path, and ideally, all
power supplies should be returned to the AC ground. Notice that I
was careful not to say 'equipment chassis' in any of that.

The voltage difference between AC ground and the low impedance RF
ground should be low, maybe a volt or so, but if its higher than
that, check into the cause before doing anything more becauses you
have a potentially dangerous situation.

Take a look at the power cords on your equipment and see which have
3 wire plugs, these will be more difficult to connect to your RF
ground, because by doing so, you have interconnected the AC and
RF grounds.

Interconnecting the grounds may not be a problem in general and
many times you can do it with no ill effects, but be aware that
doing so can cause circulating currents in the whole ground
system which will cause ground circuit noise (result of ground loops).
Separate the grounds often and check for a voltage difference

as a safety precaution. CORRECT THE PROBLEM BEFORE POWERING THE EQUIPMENT.

All power supplies with the output isolated from the chassis should be connected to AC ground only.

Computer chassis are grounded to the AC ground (and good digital design demands that this be only at one point for any one machine. this is why the RS232 interface defines a chassis ground and a separate signal ground. Not all cable manufactures implement this distinction. By convention, the chassis ground is connected to the cable shield and this shield is connected only at one end (usually the computer end). The serial interface card would then handle the signal return (ground) only. This is the way ground loops were handled in the large mainframe computers. You might want to check your computer interface card and your TNC to see what each of them do with pin 1 of a DB25 connector, if it is like the large mainframe implementation, the interface card will ground pin 1 to the chassis and the TNC will leave it open. Signal return will be on pin 7 of the DB25, and a proper cable will not connect pins 1 and 7 together.

All in all, you may have no problem, but you can fix it in your TNC if you have to do it properly. You also could try connecting your TNC chassis to the computer only and not to the rest of your ham gear which would be tied to RF ground. This would give a potential ground loop at the audio interface to the tranceiver, but is not as likely to give problems as one at digital circuits or RF circuits.

Good luck with it,
73,
Don W3FPR

Unfortunately, all terminal manufacturers did not isolate the (interface)
circuitry from the chassis and thus the signal ground (pin 7) was directly
connected to the PE (Protective Earth) bar of the building through the
3 wire power cord. The VT100/VT220 series was particulary problematic
in this respect, with lots of ground potential problems.

No, this is not a sufficient prerequisite. The important thing is what
happens to signal ground (pin 7) inside your PC. This is most likely
connected to the 0 V output voltage terminal in the power supply. To
this point is also connected the signal returns for the monitor and
the signal returns from the printer (and signal ground fom an external
modem). Only if all circuits in all these equipment float in respect to
their respective chasses, only then is it time to worry if the cable
is connected properly.

I very much doubt that you can find a PC installation (computer, monitor,
printer etc..) in which the circuitry floats respective to the chassis and
thus also floats relative to the PE bar in the building (assuming 3 wire
power cords).

> likely to give problems as one at digital circuits or RF circuits.

A simple solution:
Move the TNC to the computer and take the power from the computer
or from a separate (floating) wallwart. Put audio transformers
(say 600:600 ohms) in the microphone and loadspeaker lines and an
opto isolator for the PTT line. The opto isolator can be omitted,
if both ends of the contact in the PTT relay inside the TNC are
floating. The audio transformer only has to pass 300 - 3000 Hz, so
allmost any audio transformer will do, but if you find a type with
high breakdown voltage specification, it might save your computer
even if your station is damaged during a thunderstorm.

To avoid EMC problems from and to the computer, it is also easier to build
filters for the audio cable than for a high speed serial cable (where you
have to be careful not to distort the waveform).

I know that there is a program called SoftKiss for the Mac. However,
this program only allows 1200 baud operation. Does anyone know
a driver which is similar to SoftKiss and is able to work together
with NET/Mac at 4800 baud?

Thanks, Remco PA3FYM

Thanks for the info. Is there a docs file that explains all the in & outs
of PMNOS. If so, where can I get a copy. Also is there a PMBM mailer?? It
would nice to have a compainon mailer program.
This will make my friend happy. Could I get a copy of your autoexec.nos
for PMNOS?? It would be helpful, to see if we are setting it up correctly.
You can send it to my UUCP account, if you wish not to post it publicly.

Hello all,

I was just wondering if CLOVER is still popular? Is there a user group?
After scanning the pages of recent magazines, I could not find anymore
ads for CLOVER II boards from HAL. I admit that I have not be keeping up
with the latest happenings in the HF Digital scene.
Is CLOVER II still a viable mode for us digital hams? I hope to be able
to purchase one of HAL's board and do Keyboard to Keyboard contacts with
others.

Eh???

Gary,

Excellent article. One question, however: Assuming you bond
everything properly like a reverse daisy chain to a single point gound
at the meter entrance, is it ok to extend that gound by bonding
multiple ground rods together? Something like this

```
Ground Rod --------+ +--------Stuff in shack
| |
Ground Rod ---------+----------+--------Entrance Panel
| |
Ground Rod ---------+ +--------Tower, etc
```

Thanks,

Larry

Gary, this is perhaps the best piece I've ever seen on this topic, particularly considering that it was written within the space constraints of a news post. It is so good, in fact that I've save it for reference, something I seldom do.

I do have one reservation regarding the above paragraph, however. The level of detail you refer to is more properly described as cost of construction. This is the weak link in amateur lightning protection and the reason why most (if not all) amateur installations will never withstand a direct strike, let alone provide operator safety under such conditions.

Anyone who has ever seen a four foot thick concrete base under a commercial FM tower shattered from lightning knows what I'm talking about. There was even an article in the news recently, about a woman who was electrocucted in her bathtub when lightning hit the *underground* water pipes leading to her house.

My point is, in a direct hit, lightning takes *many* paths to ground, not just the shortest or largest cable which we provide. Even assuming that sufficient protection could be guaranteed to the equipment, the operator remains at risk as only a few milliamps are required to stop the heart.

For this reason, barring an expenditure of many thousands of dollars to install protective measures, absolute protection means staying off the air during a lightning storm and disconnecting *all* leads to the equipment. There are no exceptions to this rule.

Well, this isn't really a digital question (although it could be), or really a purely amateur question, but it is definitely a radio question, and something I know a little about. Perhaps any further followup should be conducted in rec.radio.homebrew, where the topic has appeared before, ironically in a digtal context.

The SCA "radio stations" are actually signals that are combined with the main signal of a broadcast radio station. A conventional FM radio only plays the main station, ignoring the SCA. It's kind of like the process of transmitting stereo FM, this is done in a manner that a mono radio still receives the signal properly in mono.
The "special" radios, therefore, start as conventional FM radios with the tuning fixed to the station that has the SCA signal added. But rather than play the "raw" output, they process the signal additionally to extract the SCA audio.

Uses for this technology are varied, although I don't think it ever really took off because for various reasons the signal quality is not very high, and (except in big cities), there aren't enough potential users to justify all the equipment. Also, it can degrade the main signal slightly, causing a potential loss of listeners. Public radio stations here broadcast a rather amateurish "reading" session of people reading various newspapers and magazines for the benefit of those who are blind or otherwise can't read newspapers and

magazines. In the commercial segement of the band (>92 MHz), programming is likely to be "background music" or digital services of various sorts like paging or stock quotes. In Europe, there were some experiments to link data transmitted via SCA into the "Smart Road" taxpayer-milking scheme. It is probably not legal to publicly receive these without paying a license fee to whoever is providing the service, that license fee is most likely included in the price of the special radio they sell or lease to you.

Into the more technical stuff: The SCA is transmitted as a "subcarrier" on the baseband audio. Looking at the spectrum coming out of the FM demodulator in a conventional radio, before it is de-empahsized, etc:
{Mono audio} P {Stereo Information} {SCA} (P= Stereo Pilot 19.0 KHz tone)
0 19K 38K 67K (Hz)
The SCA carrier, which is usually more than 60 KHz (57 KHz for Europe, usually 67 KHz in the USA, although it can be even higher, up to 100 KHz, especially for narrowband data), will be filtered out by a conventional radio. A good FM receiver will often include a "SCA Trap" tuned to 67 KHz to get rid of this signal entirely so it won't interfere with the stereo audio.

The SCA carrier is FM modulated with about 7 KHz deviation for an audio channel. This gives a frequency response to about 5 KHz in the baseband, so it sounds like AM radio. Actually, everything I've heard on SCA sounds *worse* than a nearby AM radio station. This is due to the other major problem: various nonlinearities in the FM transmitter, the radio channel (multipath), the IF filters, and the discriminator in the radio will cause the main channel audio and stereo information to either (1) produce harmonics in the SCA band and/or (2) cross-modulate the SCA carrier. In either case, the result is that the main channel signal bleeds over into the SCA signal, causing what sounds like static cracks and pops in the SCA when peaks are hit on the main channel, especially in stereo programming. This is not helped by the fact that the SCA signal is only about 10% of the total modulation of the radio station, so it will not take too much power away from the main channel that most receivers are listening to.

Adapters to extract the SCA signal from a conventional receiver used to be a popular magazine project, as it can theoretically be fitted to any receiver that receives commercial FM. I have built a few SCA adapters to experiment with, both magazine designs and my own, and have not been too satisfied. I also tried one commercially-produced SCA receiver and got about the same results, so I don't think my circuitry was too much at fault. I would suggest listening closely to any SCA receiver before you buy it to be sure you can live with the quality.

Any of the big US discount marine supply outlets will carry GPS receivers. The Garmin 45, currently one of the best buys, is typically sold for around $299 by these outfits. This is a wonderful little handheld unit. It's water-proof, runs off ordinary batteries or external power, and offers NMEA output to work with other marine electronics such as autopilots.

Check with your local marine supply outlets first, and if they can't approach the above price, post back and we'll give you some addresses for discount marine stores in the US.

>

The pin out information for the Kenwood data connector is in
Kenwood Application Note AAN-0010, available from them.
It's only one page long.

Here's a quick reference:

KPC9612 connectors Kenwood data connector
9600 1200
DB25 DB15 6 pin mini-din

3 1 1 (PKD)
11 6 2 (DE)
1 3 3 (PKS)
2 NC 4 (PR9)
NC 5 5 (PR1)
13 2 6 (SQC)

Don't spend money on the Kenwood mini-din cable, just buy
a PC keyboard cable and cut it in half to get two of them.

(Hope I transcribed the above pin out stuff correctly)

Hi,
I use an RCA TAC 200 for the transmitter and a Kantronics D4-10 for the reciever for the 9600 user port
repeater on my tcp/ip switch. I also use Tekk KS-960 trancievers to access the 9600 repeater. The RCA is
slightly modified in the transmitt section, but the reciever required too much work so I used a different
radio for the reciever of the repeater. I also have an IC-970 multimode that works on 9600 baud. All of the
radios I use seem to be fine, but the Tekk's did require mod's (slight). I don't know if the newer Tekks
still require mods.

SCA is SubCarrier Audio. It is a modulated subcarrier on an FM signal, i.e. an audio carrier frequency, offset by ??? kHz from the main carrier, which is itself modulated by the subcarrier audio baseband signal (voice and/or music). A similar technique is also used to carry data, to broadcast financial information, sports news, etc. SCA is often used to provide radio signals to minority ethnic communities. For example, in the Washington, DC metro area, there is (or was) an SCA signal carrying programming for the Korean-American community. The SCA technique is generally used when there is not a big-enough market or available spectrum to establish a stand-alone FM radio station. In the preceding example, specialized receivers were sold to the client audience and the sale of the receivers helped finance the service (the receivers were sold at a substantial markup, from what I understand). This technique (or a variant thereof) is also used for satellite data and audio broadcasting, in a technique known in the SatCom community as FM-squared.

This isn't meant to be a fully detailed technical explanation, just to give a general flavor. Frankly, the above is all (maybe more!) than I know about the topic. Hope you find it helpful.

I don't know of any standard receivers that will receive and demodulate the SCA signal. Perhaps someone else can provide more detail and accuracy and receiver information.

Regards,
Chip Fleming, N3USL, rffleming@aol.com

> power cords).
>
It is not necessary that the DC common circuit actually float. The
correct procedure is to connect DC common to the equipment ground
at only one point within any one machine. In PC type computers
there is usually done inside the power supply. In a properly
(read low noise) designed printed circuit board, the "ground" plane
is actually DC common, and should not be confused with earth ground.
In most IBM PC compatible motherboards, there is a mechanical mounting
stud near the keyboard connector that may be mistaken for a motherboard
grounding point - it is not = This mounting stud should have insulating
washers to keep it from grounding the DC common at that point. This
one item has cured many cases of mysterious behavior in PCs.

Again, the rule of thumb for grounding digital circuits is to connect
DC common to equipment ground at only one point within a machine, and
to be connect any signal cable shields to the equipment chassis at
only one end. I am aware that some terminal devices violate this
convention. My cynical response is that it helped them pass the
tests required to get it to market, but caused many service headaches
in the field, but my practical response says that there are always
exceptions to any convention - just be aware, and if you experience a
problem maybe you can identify the root cause a bit faster.

Please re-read Gary Coffman's earlier post on grounding. That is
something that could replace most of the words I have previously
read on grounding, and I checked the ARRL Handbooks section on
station grounding before placing my first post on this subject.
While it was somewhat informative, I found it woefully incomplete
in answering the all important WHY question that is so helpful
when the current conditions don't quite match the 'normal' and I
don't ever seem to encounter a totally 'normal' situation.

Hi Gary,

Thanks for the reply. I am sorry to hear that CLOVER does not seem to be
that big of a commercial success in keyboarding. I have noticed the
experimental stations still forwarding data , as you had mentioned, and
agree. I have tried amtor for years, and also pactor, but find these modes
boring and just too slow now. The data does get through, but the wear and
tear on the radio is ridiculous with all of the repeats. We all know that
HF packet doesn't work that well either ,but forwarders continue to use
it.

I guess I am really sad because CLOVER is the first really new mode to
hit the scene in years. It should be a great keyboarding mode.
Yes, I have tried G-TOR, but it is only a little better than Pactor. I do
like the more advanced features of G-TOR, and enjoy its speed when
conditions are good. It too seems to be a bit scarce on the HF bands.

If anyone out there thinks that CLOVER is good for keyboarding, please
say so.

Ken, WB6MLC

2492. NET_Mac2.3.52.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-10 00:00:00 UTC
From: adam@iag.tno.NL
Message-ID: <9506101143.AA08469@iag.tno.nl>
Source record: 43127

The Netherlands, June 10, 1995.
Hello dear reader,

Today I distributed NET_Mac2.3.52.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Fix a bug in the ping-command, that only shows on a Mac LC
- Increase routes-buffer for non Mac-512's
- Make NET/Mac aware of 'popmail'. See the online help for popmail...
- Inform the user about performance reduction when TRACE is ON
- Some minor enhancements for a number of commands
- Just some minor mods to trace a timer-hung problem
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital.

NET/Mac will be uploaded to PI8HVH.AMPR.ORG, directory public/mac.

Adam PA2AGA (e-mail: adam@iag.tno.nl)

>others.

Clover is still around, and HAL just introduced a new (lower cost)
board with Clover capabilities. It's called the P38, and lists for
$395. The only catch I can see is that (due to hardware limitations)
it only provides 1/2 the speed of the high end Clover board they sell.
So if you want the fastest possible Clover performance you still have
to spring for the $795 product. The new P38 board also provides AMTOR,
Pactor, and RTTY, and is compatible with software written for their
other boards.
Clover works fine for keyboard-to-keyboard chats, and hangs in there
in poor conditions better than the other modes. Its biggest problem is
that there just aren't many people using it. Same with G-TOR from
Kantronics. I know that Kantronics has sold a lot of KAMs with G-TOR
and a lot of G-TOR upgrades, but there just isn't much G-TOR activity
on the band. Why is this? I think there are 2 reasons:

1) As small as the amateur market is, proprietary digital modes will
never attract large numbers of users. HAL is the only source of Clover
and you *still* can't buy it in a standalone box, so that cuts out a
lot of folks. As far as I know, G-TOR, while licensable, is still only
available from Kantronics. Seems a lot of the folks who have licensed
it are playing the "wait and see" game. Some others are finding out
that their hardware isn't up to the task of running G-TOR, probably
much to the delight of Kantronics :-)

2) Any digital mode which is hard to monitor will not thrive in the
"ragchew" or DX arena. Yes, I know you can monitor G-TOR and Clover,
but not very well, and in the case of the KAM you give up the ability
to maintain a packet session while doing it. (The reason many bought a
KAM in the first place is so they could work HF digital modes while
staying logged on to the DX Packet Cluster.) As digital modes get
more and more complex (ie. no longer simple FSK) it becomes harder and
harder to monitor the traffic without actually being linked.

I'm impressed with both modes, and I wish them well, but I think
they're fighting an uphill battle. Just my two cents worth.

2494. Reception of HF weather fax in Washington, DC area

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-10 00:00:00 UTC
From: mikrowland@aol.com
Message-ID: <3rchgn$j35@newsbf02.news.aol.com>
Source record: 43129

I am interested whether anyone in the Washington, D.C. Metropolitan area currently receives HF weather fax. I would like to find out the feasibility of setting up an antenna specifically for weather fax reception from the USCG at Marshfield, MA on 6340.5 kHz and 12750 kHz. Does anyone in the area receive weather fax from Marshfield, MA??? On average do you get a clear signal for clean copy of weather fax ???? Which type(s) of antenna are using to receive the weather fax???? Which frequency has the best signal??? What time of the day is reception best?????

Any other information that may prove useful would be appreciated.

Thanks in advance,

Mike Rowland

2495. Kantronics KAMPlus Memory Chip - A Question

>>
What I understand as a wormhole is a non-ham conection between to packet
station. It could be phone lines, the internet or what have you. As I
understand it there is no access available from the media that conducts
the worm hole.

I have also seen the term used to refere to hf links for packet. While it
is legal there is some concern but us old farts on hf that it will take over
"our" part of the spectrum by the dreaded "no coders". This does not
concern me but it does some folks.

While in this area I do have problems with packet-internet gateways. I would
really like to do this but there is no way I can see to streach the rules of
ham radio to allow full net access. The commercial content of much of the
net and the some of the images and language on the net are plainly direct
violations of part 97. IMO part 97 should be modified to allow internet
access. Pragmaticaly I don't expect this to happen in the near future. I
hope I am wrong.

Clover is still around, but don't expect to find much keyboard to
keyboard activity using it. It's mostly used for data forwarding.
That's where it really shines, in transporting bulk data from point
A to B. For hunt and peckers, AMTOR is a better choice.

> I want to use it on 1200 and 9600 baud.

The TM733 is seriously broken for 9600 bd use. There is something wrong in
the modulation circuit causing it to produce heavy distortion when trying
to do more than 2.5 kHz deviation (at the 9600bd data input)

Furthermore, it is a PLL modulated transmitter. Not suited for the G3RUH
9600 bd system. And it is VERY slow : it needs about 100-150 ms to
switch from tx to rx and vv.

You should give some more information. What's your budget ? what use are
you planning ?

I would'nt buy any of the icom/kenwood/yeasu FM mobile rigs that claim to
be 9600 ready. Allmode sets are ok.

In QST of may 95 there are some tests of 9600bd ready equipment.

I use icom IC275 / 475 radio's, too old to have the label '9600 ready' but
they are absolutely perfect for the job.

Having used AMTOR and PACTOR I find the latter to be much more roubust on
weak links and has faster through put than AMTOR. I still work AMTOR because
everyone does not have PACTOR.

This is a real opertunity for me as I seldom find anything that Gary says
that I can find any disagreement with.

Hello,
I am not aware of any internet sites for information on Clover.
HAL electronics in the US are the manufacturers. It is a heavily DSP
based modem and the routines are proprietry. It uses a combination of
PSK and FSK and also I think uses amplitute information. I.E it is a
fairly complex waveform. There are also very few people using it I
have only worked 4 other stations from europe so far, mainly I guess
because of the poor sunspot count.
HAL have a bulletin board but the number I have for it no longer works
so I guess they have changed it!
There was a description in RSGB's Radcom of a couple of years ago.
Personally I believe that Clover will die a death for amateur
communications when Pactor II is released, my spies tell me that
certain organisations are already evaluating Pactor II.
You can hear Clover on 14.064MHZ to 14.066MHZ LSB (if yoyu are lucky)
its data bursts are a lot longer than pactor and it sounds like
a chorus of frogs!

Sorry to be so negative

>kam plus. tnx

Iam afrais I have bad news for you,

Both Clover and Pactor II use modulation waveforms that are very
complex and can only sensible be implemented in a DSP. Therefore
unless there is a DSP add on for the KAM controller it is not feasable.

I think you're right about proprietary protocols. Networkers are
leery of single source systems that won't interoperate with other
manufacturer's systems. This has hurt both Clover and GTOR. But
I don't think that the fact that Clover plugs into an ISA buss
is a drawback. I think it is very much a plus for the hardware
to be more tightly integrated with the computer platform of choice
of nearly all amateurs. And if you want a standalone box, HAL will
sell you a Clover system already plugged into a PC with the
software pre-installed on the disk. This is the way they sell the
product to the commercial market.

>more and more complex (ie. no longer simple FSK) it becomes harder and
>harder to monitor the traffic without actually being linked.

That's very true. ARQ protocols are interactive by nature. Persons
not a party to the communications are going to find it difficult
to monitor cleanly what is being transmitted. This is true of
AMTOR, GTOR, PACTOR, packet, and Clover. But it is especially true
of Clover since the raw layer 1 changes with conditions based on
negotiation between the sender and receiver. While a third party
can monitor any of these, it takes rather sophisticated firmware
to recognize and adapt of the dynamics of the protocols used.

While there are broadcast ECC protocols, a rudimentary example is AMTOR FEC, which make casual monitoring easier, they are costly in terms of performance to the primary users. So I expect monitoring to become more and more difficult as more advanced and capable protocols come on line. We must remember the reason for these protocols is to transmit data from point to point in a harsh RF environment where more rudimentary methods fail. They aren't intended for the type of casual random contacts favored by ragchewers and Dxers.

The next big step on the horizon is ALE. That *requires* the location and identity of the other station be known ahead of time. The radios then negotiate frequency, power, and modulation method to optimize the data flow between the stations depending on moment by moment conditions. Monitoring an ALE contact can be daunting indeed since the radios may even change bands between data frames depending on predictions and measurements of actual moment by moment propagation conditions. (This is vaguely, very vaguely, like the concept of trunked radio systems in that the best channel and modulation are picked dynamically during the contact. As scanner enthusiasts can tell you, monitoring trunked systems is much more difficult than monitoring fixed channel repeaters.)

The ordinary Dxer paradigm simply doesn't apply to these modes. They are optimized to transfer maximum content between two stations. They aren't optimized for random contacts with little actual content transfer. That's not to say that protocols couldn't be designed to perform the Dxer function, but the Dxer ideal is alien to most of the networkers who are producing the more advanced hardware and firmware for digital activities. Their concept is, given source and destination addresses, how do we optimize information flow between the parties?

To many digital networkers, Dxing is like picking up the phone, dialing a random number, and exchanging hellos and goodbyes (and a follow up post card) with anyone who answers. It's the exchange of post cards that's the real purpose of the contact, not the exchange of data on the air. The ragchewer's paradigm is harder to model. In some cases it is no different than the networker ideal because all the parties are known in advance. In other cases it's a hybrid of the Dx and network ideals in that the destination address may not be known in advance, but the purpose of the contact is still information exchange rather than just the fact that contact was made at all. Digital systems optimized for random contacts would look very different from systems optimized for point to point data exchange.

A question marketeers need to ask is, "What does the amateur community want?", and then design systems and protocols to meet those needs. So far, the only protocols being produced are directed toward point to point information transfer between known sources and destinations. That addresses the amateur networker's needs, and many of the amateur

ragchewer's needs, but it does little to facilitate the exchange of post cards between random persons except in the very ancillary way of the Packetcluster's Dx spotting reports. The latter seems to me rather like hunting with a pack of dogs. Some consider that sporting, some don't. Since Dxing is a sport, perhaps making connections and information exchange too easy isn't really a desirable goal. Using advanced digital protocols might be likened to lowering the basket to 6 feet to facilitate slam dunks in basketball.

What do the rest of you say? What do you want from a HF digital system?

Could you let me know what you find out Mark -

TEKK radios and Motorolas are in high regard here but I have no idea how to find them. Seem like the ideal - they seem to go for around $100 or so.

MFJ has a data radio out for 2M only that does 9.6. I think 440 will be more prevelent soon though.

You can't say it's *absolutely* incorrect. The NEC allows isolated
ground systems under certain special conditions. It would be permissible
to use an RF choke between the RF and safety grounds in a ham station.
It would be permissible, but not necessarily desirable due to the increase
in lightning hazard such a choke may represent.

>In commercial mountain top RF installation, they put a big copper plate on

Yeah, ground window technique. That's a very important tool for dealing
with lightning.

>>Interconnecting the grounds may not be a problem in general and
>>many times you can do it with no ill effects, but be aware that

>don't connect AC and RF grounds via the mike cord if you want to avoid that
>problem.

This is oversimplification. Ground loops most certainly can cause problems in station installations, which is why adhering to single point grounding practices is so important. Shorting external loops from internal loops with a ground window can *help*, but won't solve all ground loop problems. It *is* the current flows that do damage, the voltage *potentials* are just that, potentials for causing currents to flow. In any installation not using superconducting grounds, current flow on common loops will cause potential differences between cabinets that can in turn cause damaging currents to flow *through* equipment in those cabinets, very bad. That's why use of ground "busses" should be strongly discouraged. All grounds should be direct to a common single point, no daisy chains allowed.

While ground loops are a particular concern internal to the station, external ground loops can be a problem as well. Here, the Earth itself is part of the loop, and ground currents caused by a lightning strike can induce strong currents in the loops that again result in potential drops that will cause damaging currents to flow through equipment in the external loop. This can damage things like preamps, rotators, etc, that are in the outside circuit. Again, use of single point practices can reduce or eliminate this hazard.

Note that the ground window isolates external ground loops from internal ground loops, but single point practices still need to be followed on each side of the ground window. In many cases, the ground window can serve as the single point for both internal and external grounds, but that isn't mandatory.

>The person posting the original question reasoned that if one connected the

Good point! Isolated grounds typically aren't the cure for a hot shack, they are often one of the causes for a hot shack.

>
>If you do this, it makes the power supply the most likely thing to fail
>whenever a dark cloud passes overhead. You really want to connect your
>antenna grounds, tower, etc. directly to the Power AC ground.

Outside. You want the external single point *outside* the shack. You don't want to lead those currents and potentials *inside* the shack. Bond telco, power, and lightning downlead grounds to a single

point in the external circuit. Bond them again at the ground window for the internal circuit, if the ground window and the external circuit aren't the same single point ground. The latter can be a good idea for towers. There, you want your external circuit single point at the tower base so that lightning is conducted most directly to Earth.

>All in all, Don's posting contained some of the most disinformative and
>dangerous advice I have seen in a long time. I hope you look into the facts
>and form a different opinion.

Don's advice wasn't *absolutely* wrong, but most of it was bad in the general case. Some of your advice was wrong too, in certain cases, but was more applicable to the general case. Grounding is a complex topic. There are subtle installation dependent factors that make any broad generalizations, including my own, risky. Each installation needs to be carefully analyzed and appropriate grounding techniques applied to any unique topologies that may be presented. Blind adherence to guidelines, even those of the NEC, can in special circumstances lead to an unsafe or damage prone installation.

There is a shocking (!) lack of knowledge of, and thought given to, proper grounding in amateur circles. Amateurs who spend months or years tinkering with antennas and equipment often just bang a stake in the Earth and call it ground. It rarely is. The Earth is a lossy lump with no particular absolute potential at any given point. Earth is high resistance and any current flows through it cause potential differences across it. Tapping our equipment, with its usually better conductance, across that lossy lump can lead to damaging current flows through our equipment, and us!

In principle, ground serves as a single common reference potential for all our circuits. Earth is not a single potential. So Earth isn't a good ground. That's why, when we need to interconnect Earth with ground, we need to practice single point wiring practices. That doesn't mean a single point of contact with Earth, rather it means that we attach all contacts with Earth to a single point which we then use as our reference ground, and that we don't connect our circuits to any other contact point with Earth separate from that common single point unless we "short" those connections to our common point first, IE via a ground window for example.

>I would'nt buy any of the icom/kenwood/yeasu FM mobile rigs that claim to
>be 9600 ready. Allmode sets are ok.

Dangerous assumption. While most all-mode sets allow clean modulation
and demodulation of 9600 baud packet waveforms, at least after simple
modifications, their TR recovery time is often shockingly long. A local
with a TS-811 needs 1.5 seconds for full receiver recovery. Putting a
Txd of 150 in the network just for him leads to a major loss of
throughput for everyone else.

Modulation/demodulation issues aside, TR recovery is a very important
parameter in any higher speed simplex packet environment. This is often
more than the raw TR switch time, some relay switched rigs actually
have better performance than diode switched rigs. A lot depends on
how the receiver is muted, and how it recovers. With rigs that kill
B+ to the receiver during transmission, the recharging time for all
the decoupling capacitors in the receiver may dominate TR recovery
time. The more complex all mode rigs often have a problem here since
there are more decouplers to recharge. AGC can rear its ugly head
too. Potential packeteers should look at AGC recovery specifications
very carefully. A slow recovery AGC can kill performance. This isn't
an issue with FM only radios, since they rarely include AGC, but it
can be a serious issue with all mode rigs.

As far as I know, KaGOLD is not distributed as
shareware. Even if you obtain a copy from someone,
it will not run long without a registration number that
is tied to your callsign.

However, they do have a test drive version available
on their BBS. Try 714-497-5860.

I have KaGOLD 9.04 and use it with a KAM Plus. I am
quite pleased with the operation of it, and the responsivness
of the tech support has been very good.

I don't like the copy protect scheme, but I don't blame them
for having one.

You may be right, but I'd bet that things are different in the amateur market. (And I still think HAL would sell more Clover equipment if they could package it like a PK232 or a KAM with an RS-232 interface.) It just seems to me that most people want standalone boxes, not "yet another card" to plug into a PC. For myself, I find the portability of a standalone box desirable. If I want to operate Pactor when I head to the mountains I can just throw the KAM in a suitcase and use the laptop computer. I wouldn't bother to take the Clover board out of the PC or haul the entire PC along. Even in the VHF packet world, standalone boxes far outsell ISA card types. It's my opinion that the ISA card form factor has kept Clover out of a number of applications where it would really shine.

One of these applications (for me, anyway) is mobile operation. Do any of you ever operate the HF digital modes mobile? It's a blast. If you have an HF mobile rig, a multimode (KAM, PK232, etc) and a laptop computer you can really have some fun on your next trip. (Assuming someone else is driving!) On the way back from Dayton we used AMTOR on 40m and kept a 3 hour link going while driving through West Virginia. Signals and QRM were such that SSB would have been difficult, and CW was kinda slow, but AMTOR proved ideal, and it's a great way to pass the time on a long trip. I'd love to try mobile Clover, as I think it would be great with the typical mobile signals, but dragging the desktop PC into the van and figuring out how to power it is just too much hassle.

What about you? Do you prefer plug-in cards to standalone boxes for HF digital equipment?

Hello Folks,

I spotted the schematic for the Baycom Packet modem in the 6-95 issue
of 73. I was wondering if anyone knows where I can find the artwork
for that circuit? In particular, I'm looking for postscript or
DXF, etc. files available somewhere on the net.

I have looked on Baycom's WWW page, but they have no technical info
there and haven't updated since middle of last month.

If all else fails, I could fudge up my own, but I'd like to see the
official layout.

Thanks!

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.digital.misc

This is drifting a bit off the original topic, but here is some thoughts of how to operate computers, computers and TNCs or computers or remote rotator control boxes in different rooms or different buildings and how to solve the ground potential/ground loop problems.

This is based on my experience planning and maintaining computer terminal networks that are spread over a large area (one or more buildings). It is also based on the 4 wire wiring practice (three phases and neutral) used over here (230/400V) and thus is not directly aplicable to the U.S. wiring practices, but the principles are the same.

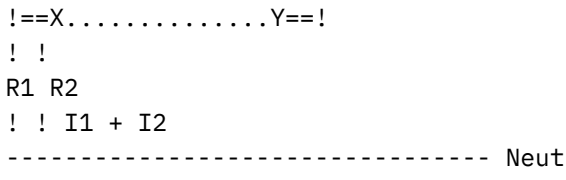
In a three phase power distribution system, no curent is supposed to flow in the neutral wire if all phases are equally loaded. The neutral wire is connected to the earth at the power company and usually in every house. In homes and offices most loads are single phase (connected between one phase and neutral) and thus the full load current is flowing in both the live and neutral wire in the cable between the fuse box and the load (wall outlet, lamps etc.) The neutrals from these cables are connected together and some cancelling takes places if loads are powered by different phases.

The protective earth (PE) in a 3 terminal wall outlet is connected to neutral in any convinient place, previously this was directly in the wall outlet, but nowadays this is usually done in a distribution box feedig the outlet.

In the ASCII drawing below, two loads are connected to the same phase (this is the worst case, but full cancellation will not occure even if they are connected to two different phases) and some computer equipment is connected to the same outlets as these big loads.

Current I1 is returning from load 1 flowing thrugh a lead resistance R1. In a similar way the return current I2 from load 2 flows through lead resistance R2. Two equipment X and Y (say a PC and a TNC) are connected as shown, the == symbol indicates Neutral and PE (the live connection is not shown). The PE is connected to N at the wall outlet or some other distribution box close to it.

```
Live I1 + I2
--------------------------------------
! !
Load1 Load2
! !
I1 ! ! I2
! Rs !
```



Putting in some typical values to illustrate what happens.
If R1 = 0.3 ohms and R2 = 0.3 ohms and I1 = 1 A and I2 = 10 A,
then X is at 0.3 V and Y at 3 V and a 2.7 V potential difference
between X and Y. If the DC-ground is connected to the chassis in
both equipment, then this voltage difference can be measured between
the signal ground terminals (pin 7). If a serial cable is connected
between the equipment with signal ground lead resistance Rs of 2.7 ohm,
allmost 1 A is flowing through the signal ground lead and also through
the circuit boards of both equipment.

The noise margin is greatly deteriorating, since the transmitter
generates the output voltage relative to its local ground reference
and the receiver senses the input voltage relative to the local ground
at its end of the line.

If a thicker wire is used, the current between X and Y will increase
and the voltage difference will drop improving the noise margin.
If Rs could be set to 0 ohms, the voltage difference would dissapear
but 4.5 A would flow through the traces on the PCB causing lots of
problems.

However, if the protective ground (pin 1) or a separate pig tail is
connected directly to the chassis _at_both_ends_ and a better conductor
(such as the shield of the cable) are used for protective ground, the
current flow through the PCB is reduced to a tolerable level.

IMHO, this is far from a good situation, since large currents are
flowing in the shield with a potential fire risk and the current will
induce interference currents into the signal lead. Connecting and
disconnecting the serial cable will most likely burn the receivers or
transmitters if done in the wrong order.

There are several ways to improve the situation

a) Rebuild the power distribution system in the building so that the
PE is kept separate from the neutral and the PEs from the wall outlets
are brought to a single point. This point is also connecting to the
neutral and the grounding electrode of the building. In the normal
(no isolation fault) case, no current is flowing in the PE network
and consequently there are no voltage drops in the wiring, thus all
PE terminals in every wall outlet (and all chassises) are at the
same potential and no ground loop currents are flowing in the serial
cable, even if the the signal/protecting grounds are connected.
This 5 wire wiring system (3 phases, Neutral and PE) are installed
on all new office buildings. However, this solution is usually not
practical for old building, neither does it help if you are connecting

two computers in two different buildings with each own grounding
electrode.

b) If the DC ground of one of the equipment can safely be floated, such
as an external modem powered by a double isolated wallwart, this is the
simplest solution. The cable shield should only be connected at the
grounded equipment end.

c) Use balanced (such as RS-422) lines. In this case both equipment can
be grounded and no signal/protective ground lines are connected in the
serial cable. As long as the ground potential difference between X
and Y are smaller than the common mode voltage range of the receiver
(usually 6.. 30 V) this will work fine. This is currently often used in
industrial sites, where there can be quite large ground potential
differences.

d) Use completely isolated (no galvanic connection) connection between
X and Y. The simplest way is to use current loop (20 mA) signaling
and optoisolators. The cable shield should be connected at one end only.
This was previously (at relatively low data rates) the most common way
to get around the ground potential problem. My suggestion (in a previous
post) to use audio transformer between the TNC and the rig is a variation
of this principle.

==========

Yes, this is good engineering practice, but look what happens when we look
at the situation at network level. If we have one computer and some
floating device at the other end, then we can apply principle b) above.
However, if you are trying to connect two computers, then principle b)
can no longer be applied due to the grounding in _each_ PC. This was
just the situation with a cumputer and multiple VT100/VT220 terminals,
which are connected just like PCs you described. It does not matter what
you do with pin 1 (protective ground), you will have circulating ground
currents through pin 7 anyway. In this case it might be better to connect
both ends of the cable shields for improved noise margin, but I do not
recommend it after having replaced line receivers on several terminals :-)
You should newer break the signal ground (pin 7) connection on RS-232 to

break the ground current, since you will end up with burnt receivers and transmitters very quickly during normal operation.

My recommendation is to ground equipment properly for electric safety and use isolation (optoisolators, transformers etc.) to transfer the signals.

Sorry for this long ranting, but hope that someone might find something useful, next time when someone is connecting together equipment in different rooms or different buildings.

Following Problem:
I have a Pentium-Processor(60 MHz) and a Baycom Modem.But they don't match.
On the Carrier is a second signal with a Frequency of about
1000Hz.I have tried everything,but I don't know what I should do.
The Modem isn't the Problem because on every other 486er...the Modem works.
Only on the Pentium(also on others)I can do what I want,it's always the same
Problem.Can anyone help me?

I am using an ICOM-271E with the MFJ TNC/modem for 9600. Other stations
in my area are using ICOM IC-290's. A small amount of work is required
to make these radios do 9600, but it was worth it! -

Jeff, You are correct, I erred, I was attempting to point out
the inconsistencies in the many and varied grounding "rules".
For example,
The National Electrical Codes require house entry grounding at
only one point - direct from the entry box. We hams have a
different criteria, and sometimes it is in conflict with the
NEC. Yes, everyone *be careful* we don't want any hams getting
zapped. Sorry I caused mis-information to flow.

I'll stick with grounding inside digital machines in the future.

HI,
Yes it is still about there is a new host program about called Express 3
which I know nothing about!
I still use it, I blame the lack of activity and ads on poor sunspots!
No seriously I haven't been on Clover for a few months and was quite
pleasantly suprised to hear a bunch of new (well new to me) stations
on in europe I even heard a couple of U.S stations on as well. There
are a couple of bulletin boards on 14.064 LSB principly TY1PS in Benin
west africa I can access it during most daylight hours.

Keep the faith.....

Regards Charles G4GUO.

2535. Anything better then 9600? 56K?

Newsgroup: rec.radio.amateur.digital.misc

I have been reading and seeing a lot about the 9600bps packet modem's around. Doing TCP/IP in KISS and all. What I was wonder if you can get one that could do better then 9600bps, like 56Kbps or slightly less? I would think that this speed could compare to bi-directional land line connections at 144K. I would like to do TCP/IP using this method. As I have a friend that is 20mi away and has to pay toll charges to connect up to the net via GTE. It would cost him $3 per hour at night.. The best band to do this on would be 70cm as it has the allotted bandwidth for this sort of thing. Any comments would greatly be appreciated.

2536. New Ham Radio Tests - Mac

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-12 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1206950404000001@wd1v.mv.com>
Source record: 43023

The HyperCard based amateur radio test simulators are being re-written with the newest version of HyperCard which makes them stand alone applications and eliminates the need of already having HyperCard.

The original design by Diana, KC1SP, is essentially preserved. But Diana has relinquished the tests to me (WD1V). Hats off to her for helping so many on the upgrade path (myself included!).

The tests are also being updated with the latest sets of pool questions.

Target release date is August 1, 1995.

They are free of cost and will be bundled with a few other helpful files.

Look for actual release information here. Feel free to contact me if you have any questions.

;>
;> Paul OH3LWR
;>

These are very good points, and Paul's suggested isolation
techniques are good both in theory and practice. The only
qualification I can add is to point out that a long distance
run (like to connect terminals to computers) has a
whole lot of considerations over and above connections
within the range of the RS232 specification. The signals
used in computer to terminal operations will cause DC level
shifts due to accumulation of charge from the signal itself,
and must be dealt with in ways different from the normal
engineering practices involved in a single room or cluster of
rooms. Different signalling waveforms and protocols have been
developed to deal with just this problem. That is not
to discount anything Paul has said, but only to paint it as
a "horse of a different color".

After mulling over the above response, I feel I need to further
clarify it. The error was in implying that there should be
2 separate grounds in the hamshack, one for RF and one for AC.
Within the shack, there should be only one ground, and everything
should be tied to it.

I wish to stand on the real intent of what I was trying to
say, and that is - there is no real single ground in any
installation, there is only the reference point we call
ground, and this should be a singular point for primary
AC power, RF grounding systems should also be at the same
potential as the AC power, although not necessarily. It is
essential that all exposed metallic cases and conductors in
any hamshack be at the same potential for personal safety,
especially for both AC power fault conditions and for lightning
strikes.

Perhaps we should adopt the more correct term "earth" to
denote an earth ground, and the term "zero voltage reference"
for all other so-called "grounds". The problem as I see it
is that the two uses of "ground" are used interchangably.

To clarify:
DC common - is not ground (especially not earth ground)
A ground plane - is not a ground
Chassis ground - is not the same as earth ground
and in ARRL schematics, they have different symbols.
Signal return ground lines - are not grounds
Signal cable shields are not ground - even on coax.

I could go on, but I trust my point has been made.

Primary power should be referenced (and safety returned) to the utility wiring ground. To do otherwise is potentially unsafe practice.

All equipment metalic cases should also be returned to the utility wiring ground for safety's sake.

What happens on the secondary side of the power transformer is a different matter. You can pick any reference point you want and use that for common. A power supply with isolated output terminals is a prime example. You can use either the positive or negative terminals as reference and call that zero volts or any other value you want. Signal paths may use this as their ground reference too. A "ground" used in this manner should not be connected to an earth ground, but you would surround it with a case that is connected to a common earth ground return. UL requires Hi-Pot testing on transformers to assure that this type of isolation can take place without the transformer breaking down.

Gary Coffman has emphasised single point grounding for an installation, and I refer you to his posts for more information. I believe he can explain it better than I.

Inside equipment cases is where my expertise lies, and I can say that each subsystem within any piece of equipment should use single point grounding (reference type) for the best noise performance. Even a ground plane on a circuit board will display a potential difference across it due to distributed impedance as well as the effects of signals flowing on the PC board traces. That is part of the reason it is prudent to think of signal return paths rather than "ground". A similar process goes on with interconnecting cables between equipment. The shield is just that - a shield, it is not a ground and should not be treated as such. My statements in the original post about an RS232 cable shield being connected to chassis (or equipment) frame ground at only one end is the best situation for noise reduction. To connect it at each end invites circulating currents by providing an alternate path even though the potential difference between the two chassis is only measured in millivolts. It is not unusual to have this kind of potential difference between units, even with a properly grounded system.

Thanks for reading this, work safely, and please read Gary Coffman's fine post on the principles of grounding a station.

Gary,

I must admit my reaction was a bit toughtless. Just angry about the crap these manufacteres (see above) are selling as '9600bd ready'.

The FM transceivers with PLL modulation are not only bad performers on the issue of 9600bd bit error rate, but their tx-rx turnaround times are also much too long - like 100 to 250 ms - to be usable for 9600bd packet.

It's a pity that the otherwise excellent article in QST magazine did not address this item.

Hi to all

This message is comming after a request from the sysop of the system
where this message is originating

The Internet router that we use is JNOS 1.10j
JNOS is doing a great job for that, everythings are running fine
It links PCboard 15.2 to the Internet via a PCboard door

He asked me if I knew a way to install some Web Pages under JNOS
directly

To my knowledge I told him that maybe it could be possible

Did someone ever tried that ?

Is possible to do it via a special software that will link to JNOS
or something like that ?

any infos will be welcome

From: cosgood@tsquare.com
Message-ID: <3rkp5d$kq6@tsquare.com>
Source record: 42944

I'm working on a program that handles a compressed version of the FCC callsign database that is now available. Currently the plain ASCII database is over 130+ Mbytes un-ZIPed. With the Coo! database format the total size is around 42 Mbytes, and best of all: any callsign can be found quickly.

Right now the program is a finger daemon for unix (Linux) based machines. It allows anyone to "finger <call>@here" and get info on the amateur.

The program is written in C++/C and is very simple. I will be making the source available shortly.

This database format is great if you want to be able to have the FCC call database accessible without having to buy new a new HD. :)

I'm checking to see if anyone is even interested in such a program, and to see if there are other programs out there like this.

Please send a message this way if you are interested, or have more information.

You can try out the program (slooowly) by finger <call>@owl.ampr.org

By using the internet or any other wire line link (generally longer distance
and high speed) it makes it possible to at least try to make a practical
network for ham messages and perhaps some traffic handling for public service
type messages. Some people are very hostile (I was one of them at one
time) since they feel that if it ain't rf all the way then it ain't real
ham radio. And they are right. It is not ham radio as we have know it.
However, if we don't make use of different technologies by combining their
strengths to make an even better system not currently duplicated by
available networks, then ham radio will continue to fall further behind.
There is no forseeable way to build higher speed links 56kbps and up that
cover the continent, much less the world. Geostationary satellites are not
financially feasible by even the most starry eyed visionary (unless
someone wills us a few million). So the only way to make the big jumps
are by hf (not possible to go fast enough except for specialized traffic
from isolated locations) or low cost (often free of cost) internet
other arrangements that can be made. And internet stuff contrary to the
comments I have heard is a very robust system. The ham stuff is not. No
emergency back ups redundant systems etc.

If we were really putting our resources into local hi speed stuff (56k
and up) and hook into the internet resources when we can't reach to
other areas outside of a given LAN/WAN area, we could have systems that
would be able to deliver messages and more in near real time. Or surely
within one day to continental points. Anything less than this, in my
view, is not viable as more and more citizens have access like we do
to internet type connections with world wide messaging in a few seconds.

Anyone who thinks they have a better solution is more than welcome to
suggest same as I would love it if we really could have a complete
bullet proof ham network that can be built with current technology.

Otherwise, my suggestion is that the whole is greater than the parts
when you design a synergistic system.

jsnodgra@ttsi.tandem.com replies:

> There are two different version of xNOS that will compile and run on
> Linux.

There are some alternatives to running a full-blown NOS if you're primarily interested in wormholes.

The "ax25ip" package takes AX.25 frames that arrive on the a KISS TNC link, encapsulates them in IP packets, and pushes them out an Internet link to another wormhole station listed in an AX25 routing table. This configuration is viewed as a simple digipeater path by end users. For example, N9XYZ might issue the command "c N1ABC via N2NET, N3NET" where N8XYZ and N1ABC are garden variety AX.25 users, and N2NET and N3NET are wormhole gateways that are known to one another. I believe that there's a list of such wormhole stations available at "ftp://ftp.ucsd.edu/hamradio".

If there's TCP/IP activity on the ham bands in your area, there's a similar package called "ipip" that performs the same encapsulation and routing services for TCP/IP packets received on the TNC link. Essentially this is just a gateway between the native Linux protocol stack and the TNC.

And while you're about it, there's also the "ax25" package, which drives a KISS TNC to provide you with basic AX.25 connectivity from the shell.

Mark continues:

> I have used dos nos in the past. I am looking for an easy to setup
> linux version.

Of course "easy" is a relative term, and one might argue that nothing on Linux is as easy as it is on DOS. All of the packages above require kernel support, which means you'll have to install the source code for these packages on "/usr/src/linux", twiddle a few configuration files, and build yourself a custom kernel. The instructions are complete, however, and fairly straight forward. I should also note that the process of building a kernel on Linux today is a lot easier than it was just a couple of years ago on SunOS.

BTW, information is cheap, but wisdom ain't. I don't have this stuff running myself yet, but I just happened to have been researching the topic when I ran across these postings. Believe it or not, I have a kernel build running in another window as I write this....

Assuming that you're root, you might create, in advance, a lot of accounts for yourself with different passwords. As you use each account, burn it, say by setting the shell to /dev/null. Then, when you again have local access to the machine, reset your accounts and give them new passwords.

Also, I have a version of passwd that lets you set the encrypted password. You have to precalculate a list of encrypted passwords (or have access to a local workstation to do it). However, this lets you change the password over an insecure net w/o an eavesdropper seeing the plaintext until you later use it to login (after which you immediate change it again).

You may ftp it from here:

ftp://ftp.cs.rpi.edu/pub/franklin/encpass.tar.gz

> Ground Rod ---------+----------+--------Entrance Panel
> | |
> Ground Rod ---------+ +--------Tower, etc

Daisy chaining of any sort is generally to be avoided. However,
this is not a daisy chain if I read the diagram correctly. What
you have is a star connected group of grounds (I'm assuming you
left out a couple of |'s in the drawing) that are connected to
a single entrance point. That's a perfectly acceptable way to
do it. IE

```
G
|
G---x------------------->house
|
G
```

That's fine. Now, if you were to do this;

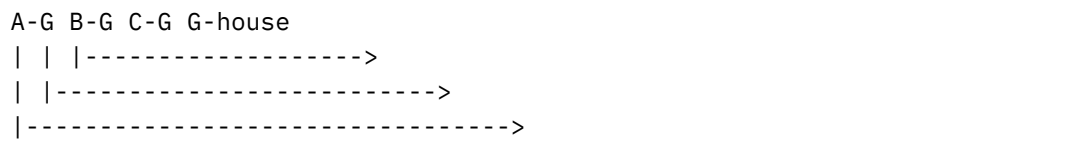
```
G------G------G-----G------G--------->house
```

That would be Ok too, but not as desirable because of the accumulated
voltage drops in the daisy chain. What you want to avoid is this;

```
A----G----G----B-----G-----C----G->house
| | |--------->
| |---------------------->
|----------------------------------->
```

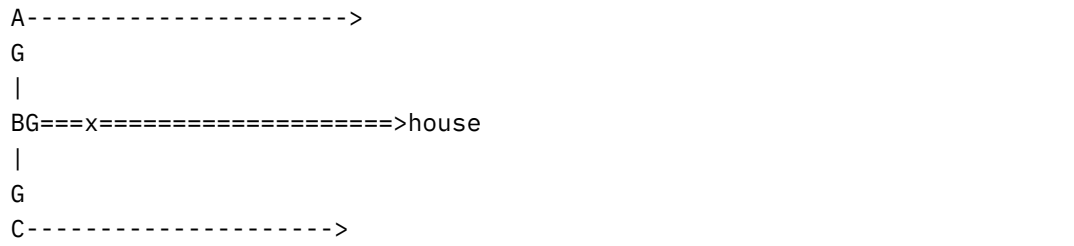
with A, B, and C representing antennas or other external
equipment. Now you have a nasty ground loop through the
chain of G's and that's going to lead to trouble. If you

do this;



This is *real* trouble. Now you're depending on the (poor) conductivity of Earth to tie the grounds together, and they'll be at wildly different potentials during a strike. Those potentials will be reflected on the cables from A, B, and C, and will do big time damage to the station if not shorted by a ground window.

Now the better way is to do this;



B's cable closely parallels the star ground run in the drawing. Since A, B, and C's grounds are tied in star, they will be at nearly the same potential. Best, however, would be individual ground runs from A, B, and C's grounds back to a single common point at the house. That avoids any ground loops.

Any of the situations that create external ground loops can be shorted by a ground window at the station entrance. That will protect the equipment *inside*, but equipment in the external circuit, preamps, rotators, etc, can still be damaged by the circulating ground currents. So it's best to avoid ground loops in the external circuit and always use a star topology.

Remember, for lightning, just having good DC conductivity isn't enough. In the first place, at 8,000+ amps of surge, even good conductivity is rarely enough to prevent substantial voltage drops. More important, however, is that lightning is RF, and low *impedances*, including reactance, are important to keep the potential differences at bay. It's always the *difference* in potential that matters. It doesn't matter if everything becomes elevated in potential, as long as everything is elevated to the *same* potential. Star topology is important to make this happen.

In the interest of home (and ham) safety, let me tell you about my experience earlier tonight.

Funny what happens when you are talking about grounding. During a storm yesterday, one of the GFI circuits in the house was tripped. Problem was that it wouldn't reset, so I went hunting for the cause. I found a defective outlet, but along the way I also found some other things that made me shudder - in the first receptacle along the wiring path, I found an exposed neutral wire that broke when I examined it. Having repaired that, I was hoping I was done, but no such luck, the next outlet on the string had 2 outbound wires from the outlet box, and there was *no* safety ground wire connecting to the duplex receptacle and the safety return wires were not adequately connected together. Correcting the open ground wire condition finally lead me to the culprit receptacle on the rear deck.

What is my point? Simply stated - trust nothing until you have checked it out. This is in a recently built house in a community that *supposedly* has one of the toughest inspection teams in the area for new structures. You can be certain that I have a task ahead of me, and I will not rest comfortably until I have checked each and every connection point in the electrical system here.

I will also be communicating what I found to the town council and the building inspection department. This is the least I can do for the protection of others as well as myself.

73,
Don W3FPR

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: A ground window is simple in concept, and simple in execution.
: Basically, it is a physically small conductive plate through
: which *every* cable that enters or leaves your station must
: pass. Every cable that is supposed to be at "ground" potential
: is bonded directly to this plate as it passes through. Every
: conductor that is not supposed to be at "ground" potential
: is bonded to the plate via an appropriate suppressor device.
: (A book could be written on that subject alone.) Then the
: plate is connected to your single point ground by a heavy
: low inductance strap conductor. Now any large potential
: difference that tries to express itself across cables
: connected to various cabinets in your shack will find itself
: shorted out at the ground window.

Question: Does every cable have to pass _through_ this, or
could this ground window be, for example, a strip of aluminum
along the back of the table (protected from accidental touching,
of course) to which all grounds for all pieces of equipment are
connected? All the power connections, serial cables, etc. such
as you mention would have their ground connection applied to
this aluminum strip, and that would be connected to the house
grounding system, probably via an outlet box as there are no
pipes in that area to connect to.

Workable?

From: ilkka.kontola@nmp.nokia.com
Message-ID: <ilkka.kontola.59.000BDEA8@nmp.nokia.com>
Source record: 43038

What kind of delay spread there is on NVIS paths? The ground wave could be one path but is there ionospheric multipath modes in NVIS?

I have no hands-on experience on (for instance) 3.5 MHz digital modulations - exept CW ;-).

In literature there are often casual comments ".... on 3.5 MHz packet the multipath is very severe problem ...." and so on. Are the article/book authors referring to DX or multi-hop paths or shorter ranges?

Has anybody developed a G3RUH compatible modem using either of the above chips.

This would save me trying to re-invent the same thing. Although I think it could be done without major investment of IC's.

The purpose is to get some of the locals into 9600+ WITHOUT having to extend their arms too deeply into their pockets (I know they will have to mod their radios - but that does not cost $$, just time).

>Can it do satellite work?
>Dan Reynolds, bcdlr@aol.com, KB9JLO

I've been using one under Jnos since Nov. it works very well. I don't see any way to seperate the ports as to protocol (ie. AX25 v KISS) but Jnos does AX25 so I have no problems there. I'm having problems getting ahold of a decent radio to use on the 9600b side, using a flaky old Kenwood, trying to get a Tekk. I run a gateway fom 440 9600b backbone to 2m & 440 1200b user ports & am thinking of adding a 2m 9600b user port this fall, I'll use another 9612 & an Alinco data radio for it.

Hope that helps some 73 N0TZL

Yes, the idea is the entrance panel is connected to several ground rods using individual cables and then not only regular house wiring but also the tower and shack rf wiring goes to the same point. Like a big star. (For some reason I can't draw that)

Where my scheme breaks down at the moment is that the tower has two individual ground rods and there is one on each of three guy wires. I'd guess that could cause a loop, eh?

Thanks,

Larry

Connect them in a star at the tower base, and then connect that
point back to the star at the house. A star of stars is an acceptable
topology.

Current practice (i.e., what I've seen recently) on mountaintop radio sites around here seems to be to have replaced the feedthrough ground plate with a simple grounding bar to which all of the incoming coaxes are bonded before they enter the building.

I can see that this is simpler and much less prone to water entrance problems, and it seems to me this might be adequate.

Is this the new practice or did someone just get real lazy?

Here in LA we think the best rigs for 9600 are

1) The TEKK Micro or Mini - see the QST article - only available for 70cm. Its cheap though !

2) The Azden ???? - also 70cm - see QST article. We just installed one on an internet gateway here - it works really well. Its NOT cheap though.

3) Old motorola taxi / police radios - I have 2 Mitreks - they are crystal controlled - and fairly easy to convert to packet operations - especially if you a have a service monitor or a skilled technician to retune the radio to the proper freq.

4) The Kantronics d4-10 data radio - although I havent tried one myself.

Good luck and 73's de Dave, kd6pro, kd6pro@desk.kd6pro.ampr.org.

Yes, that is generally true, but not absolutely so. For example,
radios that use reactance modulators after the crystal oscillator
instead of directly FMing the oscillator won't work without (sometimes)
extensive modification. And, of course, even crystal controlled radios
can be badly designed with regard to TR recovery. Then there's the
whole topic of receiver IF bandpass shape to address. There is no
single simple guideline as to which radios will work well, and which
will not.

I did some testing on a TM455. It is excellent suited for 9600bd packet.

Very fast turnaround (< 20ms) and good eye patterns.

The TM455 is the 70cm version of the TM255.

I am running a jnos server with a kantronics dvr2-2 and a kpc9612(1200
and
9600 bps). The dvr2-2 is marginal at 9600 bps. Just wondered if anyone
has an opinion on the best 2 meter radio that would be best used with the
kpc9612. I would like to take advantage of the ability to run 1200 or
9600. This
requires a data and mike connector and I configure the jnos to accept
either
speeds.

Yes, I have used mine with an old dvr2-2. The 9600 bps is marginal though
but it is in the radio no the tnc. I use mine for 1200 and 9600 bps
connections.
You need to set up the autoexec.nos attach and route.

> It's just about exactly what you're looking for.

I'll second Kevin's reccommendation. We've used S/Key at work for about a year now, and I plan to use it on my Linux box before opening it up to the world. In a nutshell, by installing S/Key you clobber the login managers ('login', 'ftp', etc.) of your choice with their S/Key versions, you cause a "challenge string" to be presented to new logins; users pump this string through the response generation program along with their secret keys, and the result is a half dozen short, English words that are entered in reply to the password prompt. Since the challenge string includes a sequence number that is decremented with each use, you can also generate a set of login keys in advance if you'll be logging in from a dumb terminal and won't be able to use the program that does this on the fly.

Also, since no one else has mentioned it in this thread, there's one more good reason for a ham to choose S/Key over other alternatives: one of the authors is "our" own Phil Karn, KA9Q. If I'm not mistaken, Phil was the original author, and his original goal was to create an authentication facility that would be secure on an RF link (where *every* user has the moral equivalent of an ethernet sniffer -- a TNC) for use with early versions of NET/NOS.

There's no reason you can't run 1200 through a Data connector, since it
requires only a subset of the bandwidth required for 9600. It should be
possible to just make up a cable that connects both ports on the 9612 to the
same radio via whatever connection is used for 9600 service.
Connect the receive audio from the radio to both port's receive inputs,
connect the PTT lines together to the radio PTT, and sum (broadcast and PA
types might say "mix") the transmit audio from both ports with a couple of
resistors of the same value, maybe 2.2K, to the radio's modulator input.
(This works because the ports don't put out a carrier unless they are keying
the radio. So the unused port would have no audio coming out.) Then adjust
the level controls inside the 9612 for proper deviation in both modes and you
should be able to take on all comers, 1200 or 9600.
This should be a stopgap measure until you have a seperate channel dedicated
to 9600 since sharing a channel may not work very well when the traffic gets
heavy. Be sure to put the ONERADIO parameter ON so the 9612 doesn't try to
transmit both modes at once, but I'm not sure if that works in KISS mode (I
don't have the book handy...)

Hello,

Thank you for reading.
I own a KAM, and have been working under SCO Unix for some
years. Recently, I switched towards windows 95.

Do you know which windows software packages exist that
run under windows (WFW, windows 95, ...), and that by
preference have tcp/ip support build in ?

Thank you for replying E-%-)

available for the HAL cards (including the P-38) from the I.D.R.A.(International
>Digital Radio Association) formerly the ADRS,
>Rick, KV9U

Hello Rick,

Do you have the address of IDRA or their internet address?

I am QRV on Clover, mind you every time I come on I work the
same 1/2 dozen stations.

One of the problems is that the original card is a full length card
and there are only a few companies that manufacture LAPTOPS that take
full length cards so it is a bit difficult to go mobile.

CLOVER is still very much in use on the bands and it might be a lot more popular in the future as HAL have just released a new plugin card for the IBM PC and clones. This new card which supports CLOVER, PACTOR, AMTOR and RTTY is called P38 and are presently selling for $395.- I have been told that the card which is using a TMS320C25 DSP processor does not support the highest CLOVER rate, but apart from that is fully compatible with the HAL PCI-4000 card. I have also been told that HAL is in contact with SCS the developers of the PACTOR modes to possibly licence the new PACTOR II mode.

A few points about cable shields seem appropriate. A number of posts referred to grounding a shield at only one end. This has some advantages and disadvantages. Clearly, having the grounded shield creates a electrostatic shield to prevent coupling of E-fields in the vicinity from coupling into the wires of the cable. By not connecting it at both ends, no currents can flow in the shield...which at first glance prevents electromagnetic coupling into the wires of the cable. This approach works best with low level audio signals in an environment with significant ground current. Examples include aircraft audio distribution, building PA systems, and so forth.

However, this has a big disadvantage in the presense of RF fields. A shield grounded at one end forms a quarter wave resonant antenna at a frequency dependant on its length. This antenna in effect focuses hi-Q resonanting currents onto the shieldat one end and high voltage RF electrostatic coupling at the other end. So, although low impedance, low frequency grounds get prevented, RF currents become encouraged.

In practice, hams should ground shields at both ends for any practical applications within a ham shack. Consider the other approach only if you have to run repeater audio from the basement of a high rise to a repeater on the top floor.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I found a defective outlet, but along the way I also found some other things that made me shudder - in the first receptacle along the wiring path, I found an exposed neutral wire that broke when I examined it. Having repaired that, I was hoping I was done, but no such luck, the next outlet on the string had 2 outbound wires from the outlet box, and there was *no* safety ground wire connecting to the duplex receptacle and the safety return wires were not adequately connected together. Correcting the open ground wire condition finally lead me to the culprit receptacle on the rear deck.

What is my point? Simply stated - trust nothing until you have checked it out. ...

Right! Folks, (if you haven't done so already) get yourself what some of us in the computer business refer to as a "Win-Lose" box. You plug it into an outlet, and two out of three lights will light up at the same intensity if things seem to be wired right. It's not perfect (my own apartment fails in an odd way, which i recognized by slightly dim light, which i know is hard to fix, being old enough to be pre-conduit), but at least you will know what you're up against. Likewise, if you're moving into a new building, do yourself a service and go around checking every outlet so you find out while it's still easy to fix.

We are limited to 300 baud on our HF bands below 10 meters by 97.305,
and on 10 meters we are limited to 1200 baud. However, note well that
baud is a technical signaling term, and baud does not have to equal
bits per second.

Yes, and that's one reason that the 1200 *baud* limitation does not seem
so bad to me. Let's take that up to the 440 band. The motorola single-IC
UHF transmitter does both AM and FM, and can do both at once. So, i guess
there's two bits per transition right there. More seem possible with an
DAC/ADC, and indeed folks like Maxim already make such chips. So, instead
of running 9600 bps, it doesn't seem hard to go to 19.2 without increasing
the channel bandwidth. Right? And bandwidth is the major concern; the
intent is not to force us to go slow.

It's common to overload a single baud with multiple
bits. All modern telco modems do it.

As us computer people have been aware of for years. For example, having
four phase states per transition, which is how the old 1200 bps Bell modems
did it. And before they became prevalent, some of us ran 1200/150 modems
(many homebrewed), as we can't type that fast anyway! That's right, folks,
the same thing we run today on VHF, but with an almost subaudible reverse-
channel.

There's a nice chart in reasonably current ARRL handbooks that summarize
Bell and CCITT modem characteristics [p. 19-34 in the 1993 edition].

I'm not speaking about use of
such techniques above, however, since they aren't necessary to get
the performance I quoted. The signaling technique I was alluding to
was simple MSK. Adding FEC etc would reduce the effective data rate
from the raw numbers quoted. Sorry if I didn't separate those two
ideas clearly.

Let's see now, it says MSK is minimum shift keying, "a form of FSK in which the frequency shift is one half the signaling rate in bauds" [ibid., p 19-30], i can't seem to find out much more about it than that. I guess FEC [ibid., p. 21-6] is like what us computer-folk know of as ECC, a fairly powerful technique...

The 60WPM figure is for a raw Baudot alphabet without error correction at 45 baud using MSK modulation. The 1.4 Hz/baud figure would apply to any alphabet of course. For example, we are limited to an occupied bandwidth of 1 kHz on the lower HF bands for data transmissions. Using MSK, we could run up to 714 baud in that bandwidth if baud higher than 300 were permissible. Using symbol overloading so that one baud represented more than one bit would increase our effective bps even further, of course. Examples of that sort of thing are QPSK and QAM. Those techniques aren't as parsimonious of spectrum as MSK though when SNR is included in the equation, IE we'd have to run higher power to get the same BER and thus limit frequency reuse to an extent.

OK, so QAM is how Bell/CCITT would run 9600 over their voice-grade lines, but i'm not sure what QPSK is like. What escapes me is how any of this is relevant to a homebrewer...

Now 97.309(a) limits the alphabets we can transmit on HF to Baudot, ASCII, and ISO646. So we can't use unspecified alphabets on HF. But that does not limit how we generate modulations to transfer those alphabets, IE how we express those patterns of ones and zeros as RF, nor does it prohibit us from using higher level protocols to facilitate the transmission of those alphabets, IE block codes, FEC, etc. Nor does it limit us in what those alphabets may *spell*. For example, we can transmit binary files by UUencoding them into the ASCII alphabet. Being restricted to only 3 alphabets is a burden, but not a serious one. We've had to deal with such limitations on computer networks for years. An 8 bit alphabet would be more natural, but we can live with the limitations of a 7 bit alphabet, albeit with considerable unnecessary overhead.

Thank you for explaining that, it wasn't clear to me. So we don't have to use straight ASCII or straight Baudot, there merely needs to be some kind of mapping into one of those whose intention is facilitate communications, not obscure them.

>on 10m) Does that mean it's simple enough to be a QST project, albeit
>probably not as easy as a QRP rig?

Sure. I've seen a number of projects in QST that were far more complex than the GRAPES RF modem (whose baseband is at 10 meters). Note that

the GRAPES modem implements MSK, but it isn't the only way to implement MSK, and other circuits could do so with fewer parts, and/or higher performance for HF usage. It is, after all, intended for high speed usage on the UHF spectrum via a transverter, but it does implement the necessary bandwidth conservation techniques, so it serves as an existance proof for the technique.

I didn't realize GRAPES does MSK. It makes sense, though. Is there any on-line documentation of that device?

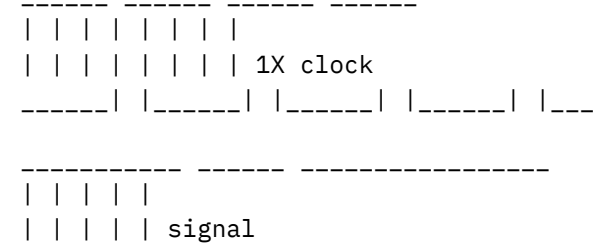
...

filter and time constants in the Costas loop. Use of simple DSP would probably make the whole exercise trivial for the baud available at HF. At the time the GRAPES modem was designed, suitable inexpensive DSP chips weren't available to deal with 56 kb and so the design had to be implemented in hardware. That adds circuit complexity that could be eliminated by use of any one of several currently available DSP chips. The GRAPES design is 8 years old, and was intended to be simple, cheap, and easy to build with parts commonly available at the time.

Yeah, using a DSP to be more than brick-wall filter for CW makes alot of sense in the HF world. I bet it could do neat things to SSB as well. I'd like it if someone would come up with DSP circuitry to run moderate (>19.2Kbps) speed packet. Heck, if someone were to properly explain the algorithms, and provide a PROM burning and/or download facility, i might even be convinced to look seriously at doing the programming.

However, the Lowfers have been using low rate codings implemented in hardware for a number of years with remarkable results. They're using effective bandwidths on the order of 0.01 Hz with nothing more elaborate than some opamps, tri-state analog switches, and TTL logic.

Wow! How does one get started in the Lowfer band (especially if one has no foreseeable interest in HF equipment)? Again, is there on-line material on this? I've never gotten along very well with the local Postal Service...
The key to
effective operation is clock synchronization. Once you have that, correlated oversampling will quickly tighten the effective passband and rapidly raise the effective SNR. Perhaps a word about this would be useful. Assume data synchronized to some clock using a simple coding scheme (a Manchester code in this case).



```
______| |_____________| |______|

0 0 1 0 data
```

A transition of the signal on the falling edge of clock signifies
a 1, no transition on the falling edge of clock signifies a 0.
It doesn't matter which way the signal transitions, only the change
of state matters. The signal always transitions on the rising edge
of clock, thus embedding clock into the signal.

Right, MFM (called DM in the Handbook [ibid., p. 19-38, also Figure 41])
allow one to recover both the data and the clock, and run at a baud
rate less than or equal to the data rate.

Now if we recover this signal and sample it with a 1X clock, we'll
be looking for the transition on the falling clock edge to determine
if we have a 1 or 0. To resolve that we have to have a fairly high
bandwidth, something on the order of 3X to 5X the clock rate or greater,
otherwise the edges of the signal will be smeared and rounded by the
IF filter and prevent a clear decision. This is undesirable since
it limits the achievable SNR. Adaptive slicers can help a little,
especially for signals that are slewed, but not much.

However, suppose we sample with a high multiple of the clock rate,
say 16x, then we have 8 samples before the suspected transition
and 8 after. If we accumulate these samples and compare their
sums at the end of the bit period, we'll have effectively narrowed
our bandwidth to 1/8th it's previous value with respect to short
duration noise, and we can now use a narrower analog filter with a
bandwidth on the order of 2X clock since a sharp edge is no longer
required to pass in order for the 1 or 0 decision to be made cleanly.

Yeah, they used to make IC's to do just that about a decade ago, like
the old 6409. Alas, nowadays, such logic is buried deep inside a disk
controller chip, or if not, expects to run in the megabit region (+/-
an order of magnitude or so). Maybe i haven't looked hard enough.
Yeah, it needed something like x16 or x32 clocks. (But UARTS want that,
too.)

With an even higher oversampling clock, we increase our effective
SNR even more. Now this assumes that the sample time is on the order
of, or less than, the average noise hit. To assure that, we may
have to lower our data rate so that the symbols are long with respect
to noise pulses. But we don't have to narrow the analog filters in
our radio by the same amount to gain the SNR advantage. The sample
and accumulate process has the effect of narrowing the bandwidth
with respect to noise.

Of course, we don't need analog filters at all with a DSP, and then one
can use filters that don't do annoying things, like ring.

Now the GRAPES MSK modem doesn't use this technique, but the Lowfer
system does. It's a fairly powerful technique for low rate signals

that's easy to implement in hardware (it's basically the principle
of a switched capacitor filter, but with the added feature of having
the sample clock locked coherently with the desired signal, and that's
a major improvement). Now, we can extend this same method, or better ones,
there are much better ones, to individual RF cycles if we have sufficient
hardware speed to deal with the high sample clock.

Or i presume if we want to operate in the VHF region, we can play these
same games, and use a DBM to get in and out of the desired band.

Now we have a powerful
technique indeed for separating coherent signals from incoherent noise. The coherent
samples add constructively, but the random noise does not, IE a
rising edge always increments over a series of samples, but the amplitude
of incoherent noise may go down as likely as it goes up at any sample
because of it's statistical nature. Thus it tends to sum to zero, or a
constant bias, over a large number of samples. Foreknowledge of the
phase of the desired signal is one of the most powerful techniques for
separating desired coherent signals from a chaotic channel. It's the
basis for the astounding weak signal performance of the NASA DSN.

OK, but can i do it at home?

>There must be some problem here i don't get, such as it's in a mode
>that we can't use yet in HF... But wait, i might still be able to have
>fun with such a device at 6m and above, where we can try out new coding
>schemes. Please, tell more, and if you want to UUENCODE diagrams and/or
>schematics in some well-known format, i'll even put it in my WWW page for
>others to access.

Clover is an existance proof that modulations other than simple FSK
are allowed on HF. It's perhaps more complex than necessary because
it has to work through ordinary analog SSB radios which are very far
from optimized for digital transmission, but the fact that it exists,
and is permissible under the rules, is ample proof that we can use
other modulations for digital data at HF than crude FSK.

Good, so there's something to point at when someone looks at me askew after
hearing one of these new signaling methods.

By and large, amateurs haven't used more advanced digital modulation
techniques on HF because (a) they don't know about them, (b) they
think they are too complex or difficult to understand, (c) they
believe (falsely) that they are illegal, (d) they're so brainwashed
into the manual Morse and analog voice paradigms of communications
that they reject out of hand better digital methods, and (e) there
have been no commercial Japanese products implementing the techniques
for amateurs to purchase.

I don't know what we can do about (d), and i'm not sure what folks who
fall into category (e) are doing in the amateur service... But (a), (b),
and (c) are things that are changable. An good article in QST might at
least dispense with (c) and possibly make a dent in (a) and (b). It's

too bad than coded technicians can still only operate non-CW on 10 meters.
No wonder the real work is happening in the 'Lowfer' band.

As for the GRAPES RF modem, its details were explained throughly
by Dale Heatherington (its designer) in one of the ARRL Computer
Network Conference Proceedings. Look for a paper on the WA4DSY
modem if you want to know more. Again I would note that this serves
merely as an existance proof for the technique. Alternate implementations
optimized for low rate signals would serve better for HF operations.

There's alot on the WWW about such things, i'll have to see if that's
on-line or merely referenced. I know the GRAPES folks have some WWW
stuff, so i'll report back if i find it. Please tell more about MSK,
and while the signal schetch was appreciated, again, circuits would be
nice, particularly things we could try out on our own, even just 'on
the bench' [literally or computationally].

2596. New Mac TCP/IP w/ POP Mail on Disk

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-15 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1506950500210001@wd1v.mv.com>
Source record: 42975

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

version NET_Mac2.3.52

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that ham radio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following new features are implemented:

- Fix a bug in the ping-command, that only shows on a Mac LC
- Increase routes-buffer for non Mac-512's
- Make NET/Mac aware of 'popmail'. See the online help for popmail...
- Inform the user about performance reduction when TRACE is ON
- Some minor enhancements for a number of commands
- Just some minor mods to trace a timer-hung problem
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital.

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

73,

I know there must be a program out there that will do what I want,
but I haven't visited enough hamfests to have scoped it out
completely.

What I'm after is a fancied-up TTY program that will allow me to
correct what I type before it goes out, and gives me a "doodling"
window to compose my thoughts and prepare them for transmission
while the other guy is sending to me. Also I would like some
standard message (brag tape) capability and the provision for buffering
up conversations and saving them to disk for logging purposes.

I can't use one of these packages that's tied to a specific piece of
hardware like the PK-232 because my terminal unit (Kantronics UTU)
is not the most common hardware by any means.

I have a C compiler and I'll write my own if I have to, but there are
enough programmers who are also radio operators that I'm sure someone
has already done a better job than I am likely to do anytime soon.

Can anyone recommend anything? Please email to
mwilson@bangate.compaq.com

......Monty.

I remember it as Subsidiary Communications Authorization.

FYI, one of our local TV stations has the SAP subcarrier that looks
to be an FM 80kHz subcarrier on the audio carrier. It will be
interesting to see what different stations end up using these
subcarriers for, if not for just regular program material.

These SAP subcarriers are part of the stereo TV specification, and most stereo TVs and VCRs are capable of decoding the primary one, intended for consumer reception. This carrier uses a wider bandwidth and dbx noise reduction, thus the audio quality is generally better than FM SCA. There are also other narrower-band SAP channels at higher subcarrier frequencies (thus lower audio quality) inteneded for private use by the station, or possibly uses similar to FM SCA, subject to regulation I suppose.
Practical applications for SAP are probably very limited, considering the inability of many people to use even the simplest electronic devices. One station once repeated the National Weather Service VHF forecast channel on their SAP, which was a useful idea, but the station was quickly flooded with calls from viewers who had inadvertently activated the SAP decoder on their TVs and were now hearing the wrong audio. The situation got so bad that the station discontinued the signal, either dropping the SAP carrier entirely (which causes most receivers to default back to "stereo" mode, even if "SAP" has been selected), or replacing it with a mono version of the main channel audio.

: WHAT MUST I LOOK FOR IN THE RADIO I AM USING FOR THIS PURPOSE?
: Pardon me if this is a FAQ but an HT seems like a special case.

: All thoughts opinions or recommendations are welcome.

: Bob kb2jrg

You'll need a tnc, a serial cable and the appropriate radio cable for
the rig you buy. Just about (if not all) HT's work just fine on packet.
MFJ sells various radio cables for Ht's already made up. There fairly
inexpensive, around $15. I use an HTX-202 for packet and it works great.
You may want to put up an outside antenna as well. I use a Cushcraft Ringo
Ranger 2
on the roof about 37 feet high. I have hit a nearby pbbs with my whip but
I recommend an external antenna so you can reach more stations should
they be around your area. I use a KPC-3 tnc and it works great. It's 1200
baud but that's O.K. Packet is a lot of fun, I think you'll enjoy it!
You'll also be able to monitor (and with some luck) connect to the
russian space staion Mir and the shuttle when they are flying their Sarex
package. Dove 17 is on 145.825, fun to monitor. You can't uplink to it
though. In case you need it here's MFJ's Number: 800-647-1800. They have
a catalog. Have fun!

2603. JVFAX SSTV - PC speaker output QUESTION

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-15 00:00:00 UTC
From: rongross@netcom.com
Message-ID: <rongrossDA883A.L16@netcom.com>
Source record: 42982

Greetings,

I am using JVFAX 7.0 for reception of SSTV. It works very well, color
and all. The problem is how to correctly/safely use the program to
send SSTV using the PC speaker as modulator output. In the docs that
come with JVFAX is a schematic suggesting how to do this. There seems,
IMHO, a real problem associated with this approach. The following
is a re-written description of the circuit from the notes that come
with JVFAX, and the apparent problem I see:

low pass filter from PC speaker to mic input at transceiver:

```
pc o---.1uf---220ohm---+----10Kohm---+--------+
spkr | | |
o---+ | | |
| | | 10Kohm
| .0047uf .0047uf vari----10Kohm----> xcvr
| | | able mic
| | | | +----> jack
| | | | |
----- ----- ----- ----- -----
--- --- --- --- ---
- - - - -
```

PROBLEM: pc speaker connector: 1 o---- logic output ----> typical
nc speaker
3 o---- ground output
4 o---- +5 vdc ----------> connection

1) you cannot use pin 4 as ground, crashes PC.
2) you cannot use pin 1 as ground, no output.
3) using pin 3 as ground provides no output from pin 1.
4) 3 and 4 together give you just that, +5 vdc power.
5) I do not wish to try just connecting it up and risk
the problem of ground loops and the such between my
computer and radio equipment even though I have isolated
the grounds electrically.

SOLUTION: 1) transformer (1:1 audio type).
2) simple capacitive/resistive coupling circuit to isolate
the PC speaker output from the rest of the world.
3) plug the speaker output into my sound card PC speaker
input, requiring the external speakers/amplifier be
on and have an output to the tranceiver.

REQUEST: Does anybody have any ideas, opinions, experiences, better ideas regarding this? I personally like solution number 1 or 2 above due to their simplicity and no need for external power/amplification.

Comments greatly appreciated... 73's...Ron Gross, N6KNF

I would prefer #1 as well since it will provide the best isolation and make it harder for any mishap on the radio end to damage the PC. Using the original circuit, taking the audio from pin 1 and finding another ground in the PC may be another way to do it, as a variation on solution #2. Your PC speaker connector probably does not have a ground, although apparently the person who wrote the instructions's apparently did on pin 3. The speaker just connects to pins 1 and 4 so the PC manufacturer isn't under any obligation to wire anything in particular to pins 2 and 3. Solution #3 is also very credible, it will also let you transmit anything you'd like via the sound card with apropriate software. The line-level audio that goes from the sound card to the speaker amplifer should be suitable to drive the radio, just use a Y connector to branch it off. It should not be necessary to leave the speakers on or modify them to provide an output.

I would strongly discourage trying to connect directly to the Internet
via Amateur Radio. Internet account most often involve a very private
password. Amateur Radio (being a wireless hobby) can be monitored very
easily.

If you are able to find a gateway from the Amateur side to the Internet,
security of the Internet account could be comprimised, and anyone seeing
the username and password (other than the owner of the account) can do
just as they please. It is really a bad idea.

Also, trying to keep up with e-mail is another area altogether. This
could be possible, but again, keep in mind, the Internet is free-for-all,
meaning messages of business, obscene, etc. nature might pass through,
jeapardizing many licensees and stations.

It is very possible to hook up via a cellular phone and satellites, but
costs do rise, and again, since this is wireless communication, is also
subject to monitoring by anyone. Sure, the law says it is illegal (at
least in the US), but who's to physically stop me from monitoring cell
phones in private?

2607. Digital Phase Detector CCT needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-15 00:00:00 UTC
From: lglaister@bbs.sd68.nanaimo.bc.ca
Message-ID: <1995Jun15.181245.3001@bbs.sd68.nanaimo.bc.ca>
Source record: 42986

I am working on a laser ranging project that uses a 30mhz IF. I need
a circuit that will detect the phase difference between the 30mhz reference
signal that is modulating the laser and the 30mhz signal received from
the photo detector. I have heard of systems using a charge pump and ADC
but I would like to stay in the digital domain. I need to resolve phase
differences of 1/100th of a nanosecond! (10ps). The only thing that
may simplify this is that I can use approximately 500 cycles to accumulate
the phase information. Brute force ECL doesnt seem to come to mind...
do any of you rf guys use circuits in microwave systems that would
operate as a digital phase detector? Are there IC's out there that do
this sort of thing for a living? Any circuits or ideas would be greatly
appreciated.

==========
Written by Lynn Richardson, June 6, 1995

CDCSS

General

CDCSS, also called DCS, is a digital subaudible selective signalling
system. It uses a code composed of 23 bits sent repeatedly at rate of
134.3 bits per second. The code is based on the Golay (23,12) code
first published in 1949. This code has the ability to detect and
correct any three bit or less error that occurs in the 23 bit word.

The word is composed of a 12 bit data field and an 11 bit parity
vector. In CDCSS usage the 12 bits are divided into 4 octal digits,
the first always being set to 100 (octal), the 2nd, 3rd and 4th digits
form the three octal digit DCS code number. The word format is:

Shift Direction -----> Out
PPPPPPPPPPPFFFCCCCCCCCC

where P's are parity bits, F's are the fixed octal digit bits, and C's
are the octal digit bits. For the DCS code "023" this would be the
binary word:

```
P P P P P P P P P P F F F C C C C C C C C
11 10 9 8 7 6 5 4 3 2 1  9 8 7 6 5 4 3 2 1
1 1 1 0 1 1 0 0 0 1 1 1 0 0 0 0 0 1 0 0 1 1
0 2 3
```

Parity Bit Generation

The original Golay algorithm used a binary polynomial to generate the parity bits, but this method uses too much microcontroller time and memory. Keeping all 512 23 bit words in rom would take a minimum of 1472 bytes, keeping the parity bits only in rom would take a minimum of 704 bytes. It is possible to save even more rom without taking a lot of microcontroller time by using a simpler way to calculate the needed parity bits. This method uses short calculations, one for each parity bit, based on selected bits from the 9 bit DCS code number:

```
P1 = C1 + C2 + C3 + C4 + C5 + C8 (MODULO TWO ADDITION)
P2 = NOT ( C2 + C3 + C4 + C5 + C6 + C9 )
P3 = C1 + C2 + C6 + C7 + C8
P4 = NOT ( C2 + C3 + C7 + C8 + C9 )
P5 = NOT ( C1 + C2 + C5 + C9 )
P6 = NOT ( C1 + C4 + C5 + C6 + C8 )
P7 = C1 + C3 + C4 + C6 + C7 + C8 + C9
P8 = C2 + C4 + C5 + C7 + C8 + C9
P9 = C3 + C5 + C6 + C8 + C9
P10 = NOT ( C4 + C6 + C7 + C9 )
P11 = NOT ( C1 + C2 + C3 + C4 + C7 )
```

DCS Transmission

The DCS word is transmitted and received in NRZ (non-return to zero) format so modulation polarity is important. The definition of a "1" is an upward frequency shift and a "0" is a downward shift. DCS codes sent with this polarity are considered to be positive polarity. However some radio systems use inverted polarity to avoid interference and these are called negative DCS codes. Because of this, provision must be made to use both polarities.

DCS code "+023" would be transmitted as:

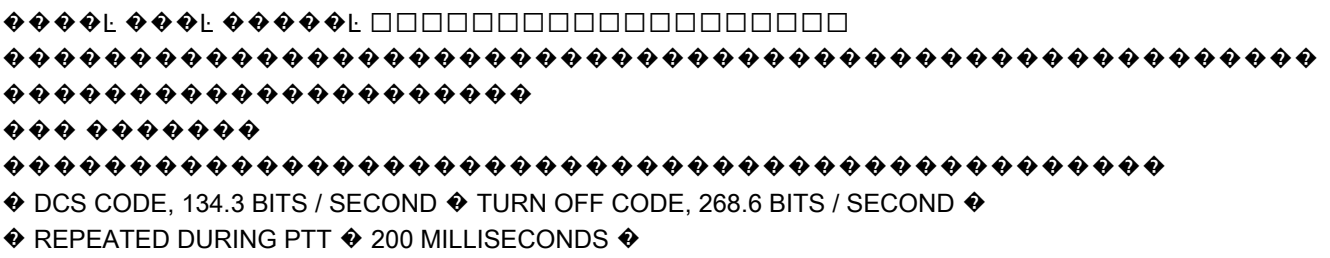
```
DCS CODE "+023"
1 1 1 0 1 1 0 0 0 1 1 1 0 0 0 0 0 1 0 0 1 1
Carrier (+)
Frequency 0
Shift (-)
```

The DCS word is sent continuously, starting when transmission begins.
When the user releases the PTT, the encoder will change the code to a
pattern of alternating 1's and 0's at 268.6 bits per second for 180
milliseconds, then stop transmitting. This "turn off" code causes
receiving decoders to mute, thereby eliminating the squelch tail noise
burst.

PTT

TX

MODULATION



Modulation Characteristics

The normal deviation range is from 10 to 20% of rated system deviation.
Most systems are rated for 5kHz, so this would be 500 to 1000Hz CDCSS
deviaton. The CDCSS modulation must be low pass filtered or have it's
waveform generated in such a way that frequency products above 300Hz
are reduced, otherwise they will cause an audible 'thrumming' noise on
the signal. Also receivers should have a 300Hz high pass audio filter
to reduce the CDCSS signal at the speaker.

DCS Decoding
>>> Continued to next message

SLMR 2.1a Batch Processing: Making a lot of cookies at once.

2609. Digital squelch 2/2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-15 00:00:00 UTC
From: lynn.richardson@sound.com
Message-ID: <6b.4871.2698@sound.com>
Source record: 42988

>>> Continued from previous message
Because there is no way to accurately determine the start of the 23 bit CDCSS code word, it is not possible to discriminate between all codes, i.e. "+023", "+340", "+766", "-047", "-375" or "-707"... all these result in the same 23 bit pattern, but shifted in time. This prevents convenient usage of all 512 possible codes. Almost all DCS codes have duplicates, so most companies use 83 to 104 of the codes, selected for low number of duplications, low falsing likelihood and good decode sensitivity. Regrettably, no industry standard recommended list of codes exists and is not likely to, so it is wise to allow for all codes and to recommend choosing from a "safe" list.

Pattern matching and software PLL techniques are normally used to accomplish the decoding.

>
>SCA is SubCarrier Audio. It is a modulated subcarrier on an FM signal,

I may be mistaken but wasn't the term S.C.A. from Subsidiary Carrier
Authorization? An FCC term that allows the subcarrier on fm stations to
provide an additional fairly low bandwidth audio. You can also buy
table radios made expressly for reception of SCA. At one time it was used
to add another educational audio channel to the public/educational radio
channels in our state,etc.The radios were not real expensive (maybe $50)
but they were fixed frequency and only received the SCA component.
I suppose you could swap out a crystal to change to another frequency.
Typically the magazines used to have simple projects using PLL circuits
to decode the SCA channel (very simple to make but you have to connect
up to the innards of a conventional fm receiver).

>
>Hello all,
>
>I was just wondering if CLOVER is still popular? Is there a user group?
>After scanning the pages of recent magazines, I could not find anymore
>ads for CLOVER II boards from HAL. I admit that I have not be keeping up
>with the latest happenings in the HF Digital scene.
>Is CLOVER II still a viable mode for us digital hams? I hope to be able
>to purchase one of HAL's board and do Keyboard to Keyboard contacts with
>others.
>
I have yet to spring for CLOVER II myself but have followed everything about
I that I could find. And that is not too much. I generally will not buy a
mode that has only one source. It has to be something that a reasonable
number of people will use in order to reach critical mass like amtor did.
And then pactor. Since no one else has licensed CLOVER II, even though they
hinted that others would as much as a year ago, I have serious doubts about
its survival. And what really messed it all up was the pactor II release
which then wound up being a year late. But it is coming. And Pactor II has
already had two other groups licensing it (rumor has it the AEA and PACCOM)
which will increase its legitimacy even more not to mention to getting the
price down as German developer stand alone box want about a kilobuck. Pactor II
will also start out with the pactor I protocol so it will figure out if the
other ham has P-II and switch to that if possible. It sounds like it is
going to be very very robust.

Now one thing that amazes me is that there are so few hams that do use
the faster modes like CLOVER II for their qso's replacing SSTV and FAX
and those modes in a 500 Hz channel. You can send perfect pix rapidly
and no hits and have rather high definition. And with the neat software
available for the HAL cards (including the P-38) from the I.D.R.A.(International
Digital Radio Association) formerly the ADRS, you can STILL keyboard with
the other ham DURING the file transfer of pix, sound, .exe files etc.
But it just has not caught on. Maybe the price. The new card at under
$400 list does most everything except pactor II. If it did that or they
would add that later for a reasonable fee (under 100 bux, say) I would
be a buyer like yesterday.

2612. Re: WWW page under JNOS 1.10?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-15 00:00:00 UTC
From: tvr@cnmat.CNMAT.Berkeley.EDU
Message-ID: <TVR.95Jun14222536@cnmat.CNMAT.Berkeley.EDU>
Source record: 42991

The Internet router that we use is JNOS 1.10j
JNOS is doing a great job for that, everythings are running fine
It links PCboard 15.2 to the Internet via a PCboard door

He asked me if I knew a way to install some Web Pages under JNOS
directly...

You don't need to put up 'httpd' to have web pages, although that is
the preferred method. You can also put WWW pages on FTP servers, and
the protocol is set up such that only the original reference need even
mention FTP. So, you first (published) link might be:

ftp://yourhost.xyz.com/~w6xyz/index.html

instead of the customary

http://yourhost.xyz.com/~w6xyz/

Which would appear in my own web page (if i chose to reference you) as

<A HREF="ftp://yourhost.xyz.com/~w6xyz/index.html">W6XYZ's page</A>

but what's nice is that *your* references might look like:

<A HREF="hfnode.html">my APRS HF gateway</A>

to refer to a page describing how your APRS server running on HF works.

Now, if you changed from running off an FTP server to running of an HTTPD
(WWW server), you won't have to change anything, nor will you have to
change your files if you move them to another directory, or even another
machine.

So, if you've got an FTP server, you're already in business to serve WWW
pages.

>intent is not to force us to go slow.

Yes. Unfortunately that was done by hardcoding baud into the regulations instead of simply being satisfied with a bandwidth specification.

>which the frequency shift is one half the signaling rate in bauds"
>[ibid., p 19-30], i can't seem to find out much more about it than
>that.

There is more to it than that, however. Simply cranking the shift down on ordinary FSK to 1/2 the baud still leaves a fairly wide spectrum. The modulation has to be coherent to take maximum advantage of the spectrum conservation offered by MSK. A typical way to generate it is with a pair of four quadrant multipliers operated in phase quadrature with the carrier.

>I guess FEC [ibid., p. 21-6] is like what us computer-folk
>know of as ECC, a fairly powerful technique...

FEC is Forward Error Correction, and basically means that information is coded into the transmission to allow the receiver to recover damaged bits without requesting a retransmission. Since the FEC information has to be transmitted on the channel with the data, it reduces effective

throughput on a noiseless channel, but because it reduces the need for retransmissions, it can in practice increase effective throughput on noisy error prone channels. There are a number of FEC techniques, some of them are identical to the common ECC methods used with computer memories, some are not.

>
>OK, so QAM is how Bell/CCITT would run 9600 over their voice-grade lines,
>but i'm not sure what QPSK is like. What escapes me is how any of this
>is relevant to a homebrewer...

QAM is Quadrature Amplitude Modulation. QPSK is Quadrature Phase Shift Keying. They are both methods of impressing modulation symbols on a carrier, and both have in common the use of four quadrant multipliers operated in phase quadrature to the carrier. For the homebrewer, this means that the hardware needs to contain a pair of multipliers, IE MC1496 or SBL-1, etc, and that they need to operate on the carrier with a 90 degree phase shift network feeding them. A pair of multipliers, or a pair of pairs of multipliers properly arranged, can be used to generate any arbitrary modulation on a carrier depending on the modulating waveforms used. In the proximate case of the GRAPES RF modem, a pair of MC1496s are fed with waveforms from a lookup ROM. The data is encoded by changing the lookup addresses to the ROM.

>even be convinced to look seriously at doing the programming.

TAPR offers a DSP card, and of course AEA has a DSP based unit. And
several of the DSP chip manufacturers offer (cheap) evaluation kits,
such as the ones from TI and Analog Devices, that can be used for this
purpose. The rest, as they say, is just software. The TI chip is most
popular, but I like the Analog Devices chip because it's much easier
to program.

>material on this? I've never gotten along very well with the local
>Postal Service...

I'm not aware of any on-line resources, but the Lowfers publish a
newsletter called The Lowdown, and articles have appeared in several
magazines, including Communications Quarterly, about their circuits
and efforts. The spectrum 160 kHz to 190 kHz is available to any
citizen with the restriction of 1 watt power and antenna and feedline
length of no more than 50 feet. No license is required (yet, the ARRL
is making a grab to make this a ham band and close it off to most
of the existing experimenters).

> with respect to noise.
>
>Of course, we don't need analog filters at all with a DSP, and then one
>can use filters that don't do annoying things, like ring.

Actually, we do still need analog filters. The dynamic range of even
16-bit ADDAs is insufficient to deal with the mixture of strong and
weak signals present on HF. We still need analog filters and AGC to
tame those differences between the desired and undesired signals on
the band. But, with DSP, we don't need to do *all* of the filtering
in the analog domain. This relaxes the filter constraints and allows
us to avoid things like analog filters so narrow that they ring.

> Now the GRAPES MSK modem doesn't use this technique, but the Lowfer

> hardware speed to deal with the high sample clock.
>
>Or i presume if we want to operate in the VHF region, we can play these
>same games, and use a DBM to get in and out of the desired band.

Only if we can preserve phase coherency. To apply the technique to
individual RF cycles would require the LO to be phase locked with
the source. In practice, this is possible but complex, normally we'd
use TRF receiver designs if we wished to do oversampling directly on
the RF waveform. TRF receivers fell into disfavor when superhets
came along because the superhet allowed a simple analog IF filter scheme
that won't work with TRF, and because the discrete circuits of the
day made TRF receivers prone to instability. That's easily solved
today with higher integration circuits, and we're doing the bulk
of our filtering in the digital domain, so the IF filter is no longer
necessary.

> Now we have a powerful
> technique indeed for separating coherent signals from incoherent noise. The coherent
samples add constructively, but the random noise does not, IE a

> separating desired coherent signals from a chaotic channel. It's the

> basis for the astounding weak signal performance of the NASA DSN.
>
>OK, but can i do it at home?

Absolutely. In fact about the only way you can do it is to homebrew
the necessary circuitry. The DSN uses atomic clocks as their precision
reference, but terrestrially we can use more mundane common clock
references. The absolute value of the clock is unimportant as long
as both transmit and receive are in sync. Any signal that can be
heard in common by transmitting and receiving stations can be used.
Broadcast transmissions are a good source of a common clock reference.
If both stations are in range of an AM or SW broadcast station, that
carrier can be used as the common reference. WWV is another source
of a common reference, as are the color subcarriers recovered from
TV-sat signals. (You can't depend on terrestrial retransmissions of
network TV signals anymore due to the near universal use of frame
synchronizers at the local stations, but the signals distributed
to the stations by satellite all originate from the same point,
and subcarrier recovered directly from a TVRO receiver will work
as a common reference.)

The common clock needed for coherent data recovery is much relaxed
from the common clock needed for actual RF cycle processing. For
data recovery, ordinary crystal stability is sufficient to keep
pairs of stations' data clocks locked together. For RF cycle
processing, either atomic references or a common external clock
source is required.

>nice, particularly things we could try out on our own, even just 'on
>the bench' [literally or computationally].

The GRAPES webpage doesn't have any technical data. That can be obtained from the referenced paper, or by ordering the manual for the modem direct from GRAPES. There is also a 1/2 hour video I produced that has the designer presenting the system in detail at the ARRL National Convention. The tape is also available from GRAPES.

2614. 9600 bps modem for PI card?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-16 00:00:00 UTC
From: jmorriso@bogomips.ee.ubc.ca
Message-ID: <1995Jun16.062706.7273@bogomips.ee.ubc.ca>
Source record: 42901

Does anyone know of a 9600 bps modem that can be added on to the
low or high speed ports of the Ottawa PI card? Either pre-built, kit
or just plans.

thanks

I use the Radio Shack HT 202 on 2m as my main packet transmitter and it works fine. I got the PK-232 and they tell you in the back of the book how to hook it up to a number of different radios including the RS. I'm sure that any local ham should be able to tell you how to hook it up properly if you don't buy one of the commercial products with a manual. 73 N9OUM

snip

: What is my point? Simply stated - trust nothing until you have
: checked it out. This is in a recently built house in a community
: that *supposedly* has one of the toughest inspection teams in the
: area for new structures. You can be certain that I have a task
: ahead of me, and I will not rest comfortably until I have checked
: each and every connection point in the electrical system here.

Imagine my surprise a few years ago when my wife mentioned, off hand,
that one of our wall switches was warm... Turned out that the electrician
didn't like to use wire nuts, and instead had used these little crimp rings
to bond wires together. Over time, any circuit with significant current
would corrode due to the relatively small contact area, which generated heat,
corroding it more, etc. By that time the black tape used to insulate the
joint was toast. Shortly after fixing that box, we got a reminder to check
the rest of the house *now*; a similar junction behind the smoke alarm down
the hall got toasty enough to set off the alarm. I found two others that were
well on their way, and decided to replace *all* connections with wire nuts.

Besides our sleeping better, the lights don't dim as much when someone plugs in
the hair dryer.

> hope I am wrong.

Gordon,

While I share some of your concern with "wide open" Internet access, I do not have a problem with any of the commercial content. What makes a transmission "commercial" is the intent of ham or ham(s) involved in the communication, sometimes that communication is obviously commercial, such as two hams employed by the same company discussing a mutual work issue on the way home on the local repeater. Other times it may be more subtle, with commercial content only known to those participants. I figure if you can order a pizza over the autopatch, I can access the FCC, ARRL, or any commercial server, via packet radio to look for any info as long as it has no COMMERCIAL value to me.

Sending an Email message via packet radio to a commercial Internet address does not necessarily make the message commercial. Even mail to or from commercial sites such as compuserve or aol from non-hams is okay. Hams have been handling third party traffic forever. The big problem is the possible activation of a transmitter by an unlicensed person. This is a major concern for links that directly pass SMTP mail over radio links.

The answer to this is to block TCP/IP port 25 (SMTP) mail from unknown locations or non 44. network addresses. A workaround would be to use POP mail, (JNOS and now NET/Mac support popmail) which would require a ham to initiate the connection to download mail. Also just holding mail at the gateway would work for this as well. Some gateways do not allow ANY access whatsoever except from ampr (44) addresses. To me this seems like an unnecessary precaution, at least under current U.S. rules. I see no rule that precludes Internet access over the radio.

BTW, I have learned more about networking and routers since playing with NOS and TCP/IP packet, than any commercial training has ever provided. Isn't education one of the purposes of this great hobby?

: >with the latest happenings in the HF Digital scene.
: >Is CLOVER II still a viable mode for us digital hams? I hope to be able
: >to purchase one of HAL's board and do Keyboard to Keyboard contacts with
: >others.

: Clover is still around, and HAL just introduced a new (lower cost)
: board with Clover capabilities. It's called the P38, and lists for
: $395. The only catch I can see is that (due to hardware limitations)
: it only provides 1/2 the speed of the high end Clover board they sell.
: So if you want the fastest possible Clover performance you still have
: to spring for the $795 product. The new P38 board also provides AMTOR,
: Pactor, and RTTY, and is compatible with software written for their
: other boards.
: Clover works fine for keyboard-to-keyboard chats, and hangs in there
: in poor conditions better than the other modes. Its biggest problem is
: that there just aren't many people using it. Same with G-TOR from
: Kantronics. I know that Kantronics has sold a lot of KAMs with G-TOR
: and a lot of G-TOR upgrades, but there just isn't much G-TOR activity
: on the band. Why is this? I think there are 2 reasons:

: 1) As small as the amateur market is, proprietary digital modes will
: never attract large numbers of users. HAL is the only source of Clover
: and you *still* can't buy it in a standalone box, so that cuts out a
: lot of folks. As far as I know, G-TOR, while licensable, is still only
: available from Kantronics. Seems a lot of the folks who have licensed
: it are playing the "wait and see" game. Some others are finding out
: that their hardware isn't up to the task of running G-TOR, probably
: much to the delight of Kantronics :-)

: 2) Any digital mode which is hard to monitor will not thrive in the
: "ragchew" or DX arena. Yes, I know you can monitor G-TOR and Clover,
: but not very well, and in the case of the KAM you give up the ability
: to maintain a packet session while doing it. (The reason many bought a
: KAM in the first place is so they could work HF digital modes while
: staying logged on to the DX Packet Cluster.) As digital modes get
: more and more complex (ie. no longer simple FSK) it becomes harder and
: harder to monitor the traffic without actually being linked.

: I'm impressed with both modes, and I wish them well, but I think
: they're fighting an uphill battle. Just my two cents worth.

Tnx Doug,

I appreciate your comments. It looks like I am going to purchase a P38
very soon. I just received the actual literature for this product from HAL
, and it still looks good despite the 50% reduction in speed.
I guess for keyboard to keyboard chatting, it will probably be ok with an ARQ
throughput of 35 bits per sec.

You're asking for phase discrimination of 0.00036 degree. That's
beyond the SOTA for a 30 MHz signal. The change will be lost in
the circuit moise. You'd have a better chance at a much higher
frequency where the discrimination required would be a larger
fraction of a cycle. Why don't you just measure the phase of the
carrier instead? A simple interferometer would handle it easily.

Sure, almost all the packet manufacturers have them. The basic
G3RUH circuit is produced by PacComm, Kantronics, MFJ, etc.
All you need to do is provide a box and power supply, and make
up a cable.

The guys are steel and not insulated from the tower. In addition,
the tower base is also grounded. I can connect all those grounds as a
star which then connects to the star at the house, but doesn't the
tower + grounds constitute 3 loops in the tower star?

IE, if the tower is grounded, a guy wire is grounded, and connecting
each of those to another, common, star create a loop?

Thanks, Gary,

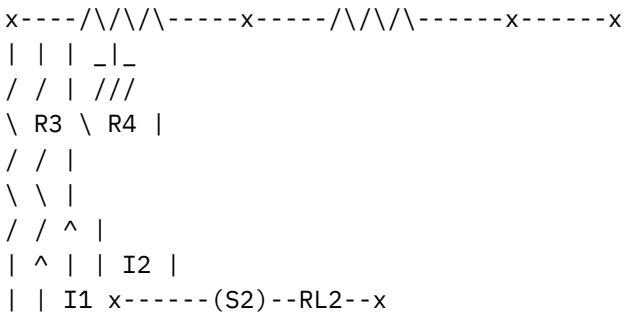
It's a circle, but it's not a ground loop. A bussbar represents a
ground loop, but it's not a circle. Confusing isn't it? The terminology
could stand improvement, as with the case of Earth and ground, they
aren't the same thing at all.

A ground loop occurs when two current meshes share a common
element. The current of one mesh modulates the potential
seen as "ground" by the other mesh, and hence indirectly
the current flowing in the second mesh. So the "loops" being
spoken of are current loops, not physical loops. And it
takes at least two current loops interacting in a certain
way across a shared impedance to create a ground loop. A
bussbar "ground" is a classic example of a ground loop.



```
| |
x-----(S1)----------RL1-----------x
```

Ok, R1 and R2 are the distributed impedance of the bussbar. R3 and S1 represent one piece of equipment, and R4 and S2 represent another piece of equipment. RL1 and RL2 are the working loads for S1 and S2 respectively. There are two current meshes. Current I2 flows through S2, R4, R2, and RL2. Current I1 flows through S1, R3, R1, R2 and RL1. R2 is the common impedance. Any change in I2 will be reflected as a different potential at the R1 side of R2, and will be seen as an elevation of "ground" potential by S1 which will alter the value of I1 flowing in that mesh. Any change in I1 will similarly show an elevated "ground" potential at S2. This is a ground loop. The potential of ground is seen as different values depending on the current flow in the *other* mesh. If lightning were to strike RL2, the value seen as ground at S1 would change dramatically, and likely cause damaging currents to flow through S1 and RL1, or between S1 and S2 if they share any interconnecting cabling.

If we eliminate the shared impedance by collapsing the buss to a star, the ground loop goes away.

The guy wires don't represent a ground loop because there aren't two current meshes.

```
x-------------(SL1)
/ | \ |
/ | \ |
/ | \ |
/ | \ |
/ | \ |
x-/\/-x-/\/--x--------x
|Rg1 | Rg2 |
|_____*______|
star
```

Where Rg1 and Rg2 are the impedances of the individual strips of Earth connecting the guy anchors with the tower base. These are shorted by the star connection and can be ignored. The current source is SL1 which represents a lightning bolt flowing current to Earth. The current will divide at the tower top, with some flowing down the tower, some flowing down one guy, and some flowing down another. The guys are in *parallel* with the tower between Earth and sky. There's only one current mesh, and no ground loop. The tower looks like the common element of our ground loop example above, but it isn't because all the currents are flowing in one mesh.

Now if the star were missing, and some piece of equipment's current mesh bridged a guy anchor and the tower base across Rg1 or Rg2, *then* you'd have a ground loop. Currents flowing

across Rg1 would induce a potential that would be seen in
the equipment current mesh, and alter the current flowing
through that mesh. By starring the grounds, we short circuit
that possibility.

When using crimp ferrules, the wires are supposed to be twisted then
crimped. The crimp is only to assure the wires don't untwist. It's not
intended to be the only electrical connection. This is a secure wiring
method when done correctly. Normally, this method is only required on
safety ground wiring, but it is acceptable practice for other wiring if
extra insulation is applied.

Wire nuts often suffer from insecure connections too, and can be a real
hazard if not properly used. Electricians use wire nuts because they
are quick, not because they are good. Ferrule crimps are required on
safety grounds because they are good, even though they are a pain to
apply properly.

You suffered from an incompetent electrician, not from a faulty wiring
practice.

: >version.

The 1.3.x Kernal has direct support for AX.25 TCP/IP built in. I did not
have too many problems setting it up. It basically treats the TNC as if
it was a regular Network Interface Card, transparantly encapsulating the
TCP/IP packets in an AX.25 packet. I believe it is compatible with NOS.

>ISA card form factor has kept Clover out of a number of applications
>where it would really shine.

The problem with standalone boxes is that they choke the entire
computer/modem interaction down to a single RS-232 stream. This
puts all status and control signaling in-band with the data stream.
This is a horrid way to operate. It forces most of the management
of the system into firmware on the modem while relegating the much
more powerful and capable computer to the status of dumb terminal.
This is a poor division of labor that thwarts most third party
enhancement of physical layer protocols, and at higher speeds,
the RS-232 link becomes a serious chokepoint to throughput.

Especially with more complex systems like Clover, having the
ability to generate multiple different interrupts or issue
complex status reports for particular channel conditions is a
powerful advantage. Not having to implement the entire protocol
on a little microcontroller chip with limited memory on-board
the modem is also a powerful advantage, as is direct DMA access
to the main computer memory for data transfer. Not having to
supply a separate cabinet and power supply are also advantages,
albeit mainly only matters of cost savings.

Yes, it rules out their use with most laptops, but consider that
with the graphical interface of many newer programs, your 1-serial

port is being contended for by the mouse and the GPS already.
Overloading it further with a standalone TNC just makes things
worse. I find that a small footprint ISA chassis is just the
ticket for permanent vehicle mounting. It can carry multiple
RS-232 ports for the various accessories, a CDROM for the
mapping program, etc. It makes a lot cleaner install than
a loose laptop and lots of trailing cables (sort of like
trying to use a HT as a mobile rig).

This is the closest group that might know. I am a candy manufacturer designing an exhibit for a New York trade show. We are building a 12 foot tall chocolate Empire State Building. I need a bright light for top tower. LED is to dull. I recall from my early electronic hobby days that a short pulse of higher than normal voltage will work on 6 or 12 volt lights when not pulsed for to long even though to much voltage is applied to light it won't burn out if very short duration is used but it does give bright flash. If anyone can help contact me at email or fax me at 516-931-2186. Best answer to my problem will recieve candy reward.
Thanks Peter

The AN-93, after considerable delays, is schedule to be available in July. So, no one has the TAPR version working. Several built the kit that it is based on that Johan Forrer, KC7WW did.

The TAPR version of the kit will support both AFKS and FSK output and provide on-board alignment. No test equipment is required (as of the beta-test) to align the modem for use -- the an-93 itself is the test equipment.

Hope that helps.

I am really looking forward to this kit being available. It is a kit that many more amateur can build and have fun with than some of our more technically aimed kits.

Cheers - Greg, WD5IVD
Pres TAPR

>referring to DX or multi-hop paths or shorter ranges?

NVIS is a skywave propagation mode. At short range there may be a groundwave component as well, but in most cases it is not significant. You get skywave multipath any time you operate far below the current MUF, as you always do on 80 meters. The multipath is caused by varying densities of the ionospheric layers returning signals at multiple incidence angles. At its most severe, this multipath is called selective fading, and is very annoying on AM voice. The problem for data modes is most severe when the multipath rate and the symbol rate are nearly the same. For typical 80 meter paths, the maximum path length difference is about 286 meters. This correlates unfortunately well with 300 baud. As you move to higher frequencies, approaching the MUF, there are fewer incidence angles supported by the ionosphere to generate multipath and the problem becomes progressively less severe.

A much lower or much higher symbol rate will still allow you to get through, but ordinary 300 baud FSK packet falls right in the worst part of the multipath window. You can make use of that old standby, diversity reception, to avoid the problem. And, of course, a robust FEC can also deal with the problem. Using a different symbol rate is usually the easiest cure, however. The 45 baud of ordinary RTTY works much better than 300 baud during periods of multipath, and is one of the reasons 45 baud was chosen for much of HF operation. A high baud of 2400 or greater would also effectively dodge the problem, but is unfortunately prohibited by regulation.

>Exactly what do I need (I have the computer with serial port!).
>WHAT MUST I LOOK FOR IN THE RADIO I AM USING FOR THIS PURPOSE?
>Pardon me if this is a FAQ but an HT seems like a special case.

HTs are perhaps the worst possible choice for packet operation.
They are underpowered, have intermod prone receivers, and typically
long TR switching time due to the "leaky PTT" keying methods usually
employed. It's very difficult to do the internal modifications necessary
to inject modulation directly at the varactor, and difficult to tap the
demodulated signal directly at the discriminator in order to avoid the
waveshape distortions of the radio's audio circuits.

If you must use a HT, the best choices are older crystal controlled
units with separate PTT switching and tight RF filtering in the
front end. Motorola HT220 or GE Mastr PE series HTs will work fairly
satisfactorily if you have a good outside antenna. None of the current
generation of Gameboy radios will work well, though the Radio Shack
HTX-202 is head and shoulders better than the rest.

Alas, this is all too true. We've discontinued SAP programming for
this very reason. Now if we can just follow the lead of the French
and get rid of those stupid hue and tint knobs, we'll have a fighting
chance of getting video into the home that looks even vaguely like
what we transmit. It seems impossible to underestimate the intelligence
of the average TV viewer, even potted plants are smarter. At least they
would leave things at factory defaults (and likely wouldn't sit still
for things like Donahue, Montel, or Geraldo either). Sheesh, don't
get me started. I just finished analyzing the May book, and the things
people prefer to watch are appalling.

>major concern for links that directly pass SMTP mail over radio links.

It's not interconnection to commercial networks that's the issue. After all, we interconnect with the commercial telephone network every time we make a phone patch. And the idea of unlicensed persons activating a transmitter is a strawman issue. There are two real problems.

Problem one is with the 3rd party *content* of the net that may get transmitted over the amateur link. Junk Email advertising is an example of inappropriate commercial use of amateur radio. The intent of the gateway operator, or the intent of the amateur on packet isn't the issue. The issue is the intent of the originator of the third party *content* being transmitted. The junk Email sender is expecting a commercial return from his Emailings. Similarly, the "adult" language of many users of the internet is inappropriate content for amateur radio.

The gateway operator is putting his license at risk every time he transmits third party content. He's *always* responsible for it.

This brings us to problem two, which is that third party traffic can't be *originated onto amateur radio* under automatic control. It doesn't matter where the traffic originally started its trip *outside* of amateur radio, the only thing the FCC cares about is the point where it originates *onto amateur radio*. This is a major sticking point. Under the rules, third party traffic may not be transmitted under automatic control except when relaying amateur radio AX25 signals. Since the gateway represents an *originating* point for the amateur AX25 radio traffic, it doesn't fall under the provisions for automatic control. An operator must be present, and monitoring the third party content, for the operation to be legal.

This is why concerns over an unlicensed person activating a transmitter is a strawman issue. The third party would have to seize physical control of the PTT to do that. Remember, the FCC is only concerned about who controls *transmitters*. Transmitters can be automatically controlled in certain limited cases, or they can be manually controlled by a human operator. If a transmitter responds to external inputs by activating, it's operating under automatic control. It's *not* being activated by a third party, it's being activated by the automatic controller which is running a program to activate the transmitter when certain input conditions occur. It's the licensee's responsibility to insure that the automatic controller only operates the transmitter in accordance with the automatic control rules, and that means *never* when originating third party traffic onto amateur radio.

When third party traffic is being transmitted, the transmitter can only be activated under the direct control of the control operator of the gateway. Automatic control cannot be used. This is identical with the situation of the phone patch. A control operator must be present and in control of the station with the patch during all third party content transfers. The control operator, and the licensee if different, are responsible for insuring that every bit of third party content is allowable under amateur rules. It doesn't even matter if the third party is an amateur or not. As long as the traffic is not being originated *on* amateur radio, it cannot be automatically relayed *via* amateur radio, IE an amateur talking on the telephone side of a phone patch is just an ordinary third party as far as the rules are concerned. His amateur status is of no consequence in this situation since he isn't controlling a transmitter.

Anyone operating an internet<->amateur radio gateway under automatic control is violating Part 97.

The case of wormholes is different since the traffic originates in the amateur radio domain and terminates in the amateur radio domain. The internet in this case just serves as a wire connecting

transmitter with receiver, and automatic control can be used in
exactly the same manner as a split site repeater can use a phone
link between receiver and transmitter and still function under
automatic control (unless a phone patch is added, in which case
the repeater must go back under manual supervised control of
the control operator during third party access).

Except that the world is a MS-DOS PeeCee, in the eyes of the
manufacturers. DOS drivers don't help me get these devices running
on my {FreeBSD,BSD/OS.Linux} systems. People who are *seriously*
interested in building networks (vs head-to-head chat) are not
using DOS these days.

When the vendors recognize that open systems (gawd I hate that term)
are where it's at we will get somewhere. Can you imagine proprietary
SSB encoding schemes?

It's time to hammer on the manufacturers to start publishing encoding
schemes and *software* *implementations* of those encoding schemes.
Either they realize this is in their own best interest or they go the
way of Wang. Unlike the PC market, in ham radio the bucks are still
to be made in the hardware. If we ever make soldering part of the
amateur radio exams that might change. I'm not holding my breath on
that one, however.

True, but they're still using ISA architecture busses for the most
part. The rest is just software. :-)

Most of the card based products do offer source for drivers, and
all the various protocols have been published. It may only be DOS
source, but still, any halfway competent programmer can take that
and convert it to work in any OS. If you want plug and play, then
you're going to be stuck in a Micro$oft world.

Lots, and ethernet uses plugin cards, not external boxes, so that
the computer can communicate with the card over more than a single
bitstream. There are status and control ports that are out-of-band
from the data. This is exactly the right model for packet interfaces,
they should behave like ethernet interfaces.

I disagree

FCC 94-76, effective June 1, 1994 changed a few things.

The following definition was added:

97.3 Definitions.

(28) Message forwarding system. A group of amateur stations participating
in a voluntary, cooperative, interactive arrangement where communications are
sent from the control operator of an originating station to the control
operator of one or more destination stations by one or more forwarding
stations.

Section 97.109(e) was revised to read as follows:

97.109 Station control. - (a) Each amateur station must have at least one control point.

(b) When a station is being locally controlled, the control operator must be at the control point. Any station may be locally controlled.

(c) When a station is being remotely controlled, the control operator must be at the control point. Any station may be remotely controlled.

(d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations transmitting RTTY or data emissions on the 6 m or shorter wavelength bands, and stations specifically designated elsewhere in this part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.

(e) No station may be automatically controlled while transmitting third party communications, except a station participating as a forwarding station in a message forwarding system.

Section 97.219 was added to read as follows:

97.219 Message forwarding system.

(a) Any amateur station may participate in a message forwarding system, subject to the privileges of the class of operator license held.

(b) For stations participating in a message forwarding system, the control operator of the station originating a message is primarily accountable for any violation of the rules in this Part contained in the message.

(c) Except as noted in paragraph (d) of this section, for stations participating in a message forwarding system, the control operators of forwarding stations that retransmit inadvertently communications that violate the rules in this Part are not accountable for the violative communications. They are, however, responsible for discontinuing such communications once they become aware of their presence.

(d) For stations participating in a message forwarding system, the control operator of the first forwarding station must:

(1) Authenticate the identity of the station from which it accepts communications on behalf of the system; or

(2) Accept accountability for any violation of the rules in this Part contained in messages it retransmits to the system.

>
> This brings us to problem two, which is that third party traffic

> legal.

FCC comments (from the Report and Order):

"5. There is no central supervisory authority in an ad hoc amateur service digital network. The vulnerability of an unsupervised system can make it an easy target for misuse by uncooperative operators and non-licensees. It can be difficult, moreover, to establish after the fact that a particular VHF station originated a fleeting high speed digital transmission. For these reasons, there must be on-going oversight of the system. The control operators of the first forwarding stations are in the best position to provide such oversight. They are the stations that accept, on behalf of the system, messages from originating stations. We will, therefore, accept the League's recommendation. We are amending the rules substantially as proposed to hold accountable only the licensee of the station originating a message and the license of the first station forwarding a message in a high speed message forwarding system. The licensee of the first forwarding station must either authenticate the identity of the station from which it accepts communications on behalf of the system, or accept accountability for the content of the message. The matter of message format, however, will be left with the designers of the systems. Since we believe our modification to the rule is sufficient to insure accountability for violative communications, we see no need to specify any particular message format. The League also requests that we clarify which station in a message forwarding system is the first forwarding station. The answer is that it is the station that receives a communication directly from the originating station and introduces it into the message forwarding system."

I comment:

The FCC seems to allow two alternatives to the "first forwarding" stations: either authenticate the originating station or accept accountability for content. Since gateway access is controlled by password and SMTP mail through the router can be blocked, or changed into POP mail (again password restricted to a list of known stations), I'll accept that risk. The FCC didn't say it wasn't allowed, They said if you do, you are responsible for compliance with the rules. I believe I can ensure compliance with the rules with a combination of controls over the users, and remote control of the station. At least on a gateway, I can deny access to specific stations without affecting other users. (now THAT would be a handy feature on a voice repeater <smile>)

Also in the rule change, the FCC removed the specific references to AX25

> This is why concerns over an unlicensed person activating a
> transmitter is a strawman issue. The third party would have

> a transmitter responds to external inputs by activating, it's
> operating under automatic control.

In some cases true, but it could also be operating remote control by
commands delivered over the Internet. If the station is under
remote control, it is no longer under automatic control.

>It's *not* being activated by
> a third party, it's being activated by the automatic controller
> which is running a program to activate the transmitter when certain

> when originating third party traffic onto amateur radio.

> When third party traffic is being transmitted, the transmitter can
> only be activated under the direct control of the control operator
> of the gateway. Automatic control cannot be used.

Again from 97.109
(e) No station may be automatically controlled while transmitting third
party communications, except a station participating as a forwarding station
in a message forwarding system.

All told, with the controls I have over the machine, (router restrictions,
POPmail) and allowing or denying access to specific users, I am
comfortable with operating the gateway under automatic control,
even supporting email transport. Just because a system CAN be used
illegally, doesn't mean I have to turn it off. As a control operator,
I DO have a serious obligation to eliminating obvious risks (no USEnet
for example), monitoring it, and taking corrective action when necessary.
This is no different than any Ham Radio activity.

2654. Help with tranciever for 2400 BPS modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-18 00:00:00 UTC
From: site@flood.xnet.com
Message-ID: <3s0a4t$j1o@flood.xnet.com>
Source record: 42846

If any one of you experts out there could help me I would appreciate it. I am currently building a 2400 bps modem from a EXAR chipset. That's no problem :) But from what I gather I just send the audio in/out to a transiever. Will any voice transiever work? What frequency should I look for? I need a range of around 5 miles, but if that's not practicle I can settle for 500 ft. <grumble grumble>. Do I need a license for this, if so where can I get a good book to study for the FCC license. As you can see I'm very new to radio.

Oh, BTW respond to site@xnet.com, thanks!

2655. Broadcast Protocol ??

Hi,
looking for any work that someone may of done using the Broadcast Protocol to "simulate " the same transmission as the satellites. I believe there is some commerical arrangement with the code used on the birds.

We are trying to develop a PBBS forwarding system within Brisbane using a broadcast protocol so that one major host can forward to all BBS's within the Brisbane area. The efficiency of Broadcast is very good, as many know in the satellite area.

Actually the hardware made by the Germans is also called Baycom. It is
licensed in the U.S. to Paccomm and sold by them. Baypac and several others
are clones.

Ok, now I understand. It's the common point obtained by tying the bottom of the guys and tower together in a star which changes the configuration from a loop to a "mesh". In turn by tying the mesh into a the star at the house entrance panel eliminates the loop which might be formed between the two stars were they not connected.

Thanks for the help, Gary.

>
>Ok, now I understand. It's the common point obtained by tying the
>bottom of the guys and tower together in a star which changes the
>configuration from a loop to a "mesh".

No. It's not a ground loop because there's only *one* current mesh.
To have a ground loop requires two (or more) current meshes that share
a common impedance. We'd have a ground loop if there were a *second*
mesh, that included some equipment we are trying to protect, that
shared a common impedance with the first current mesh. The common
impedance of the two meshes in this case would be either Rg1 or Rg2
depending on the topology. By connecting the guy grounds in star back
at the tower base, we drastically lower the value of the common impedance
and reduce any ground loop effects. If the star connections are low
enough in impedance, we can say we have effectively short circuited
the ground loop. The ground loop would still be *there*, it just
wouldn't have much of an effect because the common impedance would
be so small.

"Mesh" is just a way of saying "circuit" in analytic terms for
certain current paths. There's nothing more to it than that.
When we analyze a complex circuit, we break it into simpler
closed current paths and call each of those a mesh. We can
then analyze each mesh, noting any common elements with other
meshes, and then combine them all back together, using those
common elements as the interaction points, to get a complete
picture of overall circuit behavior.

A mesh with no shared common impedances with another mesh is
a closed circle, but it's not a ground loop. Earth is a giant
sheet resistance, however, and when we make a connection to
Earth anywhere, there will be a common impedance with every
other connection to Earth anywhere else. Mostly those common
impedances will be fairly high, and we can short them out by
doing a low impedance star connection between the points.

>In turn by tying the mesh into
>a the star at the house entrance panel eliminates the loop which might
>be formed between the two stars were they not connected.

Yeah. A star connection shorts out the common impedance needed to
have a ground loop. Note that we don't much care about absolute
potentials in any of this. We simply *define* one of our star
points as reference ground. All we really care about is potential
values *relative* to that reference point. If we arrange our
wiring topology right, we can keep those relative potentials to
a minimum.

In point of fact, *all* potentials are relative. We just aren't very used to thinking of them that way. We tend to take "ground" as zero volts, but of course it is only if we define it to be. And if it has any impedance at all, we can only define it to be zero at *one* point. That's our single point in our grounding system.

Let me take a moment to explain where the term "ground" came from. When we say "ground", we really mean *ground potential*. All potentials are referenced to this ground potential. This idea is modeled on the idea of a weight suspended above "the ground". The higher the weight is above ground, the more gravitational potential energy it has. The closer it is to ground, the less gravitational potential energy it has. When it is sitting on the ground, we say it has zero gravitational potential energy. We could have the weight suspended above a table, and the table would become "ground". Ground is the potential reference, the defined zero state. This concept was well known when electrical physics started, and the term "ground" just carried over. We shouldn't confuse it with Earth. Earth is a non-homogeneous sheet resistance. No two points on Earth have the same potential when currents are flowing between them. Earth is not ground, though we can pick a single point on Earth and *define* it as ground for some particular circuit. But we can also pick some point not on Earth and define it as ground instead, and we usually do because we can arrange for that point to be tied to other points via simple low impedance paths that can be easily analyzed and controlled.

A compendium of all issues are available from ftp.cs.buffalo.edu as \pub\ham-radio\mlhackXX.zip, or on SimTel archives (eg. oak.oakland.edu) as \SimTel\msdos\packet\mlhackXX.zip. The XX in the filename indicates the last issue number, and replaces the previous convention of using mlhacker.zip for all compendiums.

Notice my email address has changed and the direct dial data line has been terminated. The administrative overhead of maintaining personalized "electronic superhighway" access has been too much. I'm hunkering down, and consolidating all my activity into one commercial account just like everybody else. I still only have regional access. If you have a recommendation about which national or international provider provides the most complete, powerful, and lucid text based access to Internet, I would love to hear it.

January through May have been quiet months - no MLH volumes were issued. Sorry about the delay to those of you who asked. No I haven't fallen off the face of the earth! February was vacation time for the family, driving across this great country one more time to visit friends and family. March and April were spent in Alabama at a military "middle management" school. May sort of dissolved into a lot of catch-up activity, and <poof!> I find it's already June. Time flies! August through December I expect to be busy at a military Space Tactics School. I'm not sure what network access I've have there. I'm sure I'll bring a small packet radio station, but I may not have Internet access.

>>> AUTOMATED PULLUP FROM THE BOOTSTRAPS
I don't buy lithium batteries anymore. When the NiCd batteries die, the entire RAM disk dies. I've developed some batch files that will rebuild the entire environment in under 3 minutes. I've used them for over a year, but now they incorporate the Stacker setup discussed in the previous issue. First, you need to make a removable disk with the following files:

```
CONFIG SYS 38 12-30-94 2:48a
AUTOEXEC BAT 128 12-30-94 2:20a
STACKER COM 47266 6-27-91 1:12a
SCREATE COM 2762 6-27-91 1:12a
SCREXEC EXE 38565 6-27-91 1:12a
SCREXEC2 EXE 27974 6-27-91 1:12a
SETUP1 BAT 257 12-30-94 3:18a
```

```
SETUP2 BAT 15 12-30-94 3:05a
SETUP3 BAT 102 12-30-94 3:16a
SCHECK EXE 30646 6-27-91 1:12a
PKUNZIP EXE 23528 3-15-90 16:52p
UTIL ZIP 84904 12-30-94 12:34a
```

Just power up the brain dead minisport (only disk C:), stick in the removable disk with these files and enter the command "A:SETUP1". But what's in the customized files? Below I list the name, followed by the contents of each file that isn't a .COM or .EXE file:

```
CONFIG SYS 38 12-30-94 2:48a
device=d:\stacker.com d:\stacvol.000
```

```
AUTOEXEC BAT 128 12-30-94 2:20a
@echo off
echo BjM (InCrea) P autoexec.bat
path c:\;d:\;e:\util
prompt $p$g
verify on
e:
set lfbrowse=l
set lfedit=ed
```

```
SETUP1 BAT 257 12-30-94 3:18a
c:format d:
c:label d:
a:screate d:stacvol.000 /s=1.2 /m
copy a:config.sys d:\
copy a:stacker.com d:\
copy a:setup2.bat d:\autoexec.bat
copy a:fastwire.cfg d:\
copy a:scheck.exe d:\
echo Auto warm boot to recognize disk E: and continue setting up.
```

```
SETUP2 BAT 15 12-30-94 3:05a
a:\setup3.bat
```

```
SETUP3 BAT 102 12-30-94 3:16a
e:
mkdir util
cd e:\util
a:pkunzip a:util
cd \
c:label e:
copy a:autoexec.bat d:\
d:\autoexec
```

```
UTIL ZIP 84904 12-30-94 12:34a
This file has zipped up version of your favorite utilities you'd like
copied into a subdirectory on disk E:, with automatic reference via the
MS-DOS PATH command.
```

>>> BREAKING INTO BATTERY PACKS
A standard ZA-1-2 battery pack is 13.2cm wide, 2.7cm tall, and 5.5cm deep. Orient it in front of you so the black round charger connection is to the left. The metal contacts are on the bottom, also toward the left side of the pack. The manufacturer's label is on the top. If you pull loose the manufacturer's label, you can reach into the battery pack and touch the thermal cutout switch wired between two of the five series cells.

If you want to do anything else (like replace a cell), you'll have to be more aggressive! The top section of the case has an approximately 1mm lip that slides down inside the lower case, all around the edge. Use a thick blade knife that won't bend. Slip it into the seam around the periphery of the pack, push inward and lift the handle of the blade upward to crack the glue seal in several places. The goal is to pull the lower case away from the inner lip of the upper case. My case had only spots of glue - three across the front, three across the back, one on the right and one on the left.

All the cells are lined up on the right side of the pack, next to each other, with no space between. The left 1.5cm of the pack contains a circuit board containing the three contacts showing on the bottom, the board mount charging jack, and a tiny surface mount 0.1uf capacitor. I didn't look on the bottom of the board because I'd have to desolder all three slide tabs to do so.

The cells are the same size as a standard C-cell NiCd battery. They all have solder tabs. I've had good luck purchasing new batteries from E.F. Yost & Co, 2211D Parview Rd, Middleton, WI 53562, 608-831-3443. If you replace one battery, replace all five of them using the same brand and model of battery. I'm a battery consumer just like you are, and don't like buying what I don't need. I even keep all my 1sees and 2sees out in the garage. Nevertheless, every time I replace a single cell, I'm back into the pack a few months later repeating surgery. My opinion.

2660. Windows NT and AX.25 Device Driver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-18 00:00:00 UTC
From: ttalley@interserv.com
Message-ID: <3s13i3$deb@data.interserv.net>
Source record: 42940
Cross-posted to: comp.os.ms-windows.networking.tcp-ip,rec.radio.amateur.digital.misc

I would like to develop a device driver for Windows NT that
supports the Amateur Packet Radio AX.25 standard.

Just wondering how best to place such a device driver
(i.e. protocol stack).

Or has someone already started?

Tnx Tom

2661. Why is 'mbox jumpstart' command gone in JNOS???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-18 00:00:00 UTC
From: skrol@inter.nl.net
Message-ID: <DADMKo.Bzp@inter.NL.net>
Source record: 42941

Haai there,

Is there someone who can tell me why the 'mbox jumpstart' command is left out
in JNOS versions later than (I think) version 1.08d??
I read a little text about it in the readme.now file, but I don't know what
wrong jumpstarts there were. I know that you can define a ax25 bbscall to get
your mbox jumpstarted with an ax25 connection, but your beacon will be
transmitted with the hwaddress callsign. So when someone sees you and doesn't
know what program you're running (or whatever) he/she will trie make a
connection to the hwaddress callsign. He or she doesn't know that you have
to send an enter (or something else) to get into the mailbox. He or she will
disconnect, because they think it's due to a bad link. Are there that kind of
problems so that it's not possible to get the 'mbox jumpstart' command back?
I know that the command still exists in TNOS (version 1.13 and it's probably
the latest??).

Greetings,
Sjoerd.

>Tnx Tom
>

Tom:

This isn't my 'forte', but I wonder if you could do it in the same
manner as the other protocols; IE TCPIP.SYS and the like. That way,
'other' net services could bind to it, and the NT installable service
for FTP, (as well as others) would work as well. I am using the EMWAC
versions of HTML server on our (cabled) LAN, and it would be a real
kick to be able to 'shim' them to AX.25. Of course,
you'd have to write your own version of WSOCK32.DLL as well, but
man, whatta way to go !

I'm not much of an NT C++ programmer, but subscribe to MSDN Level II,
so if you need any reference help, lemme know. I also have another
compiler (XBASIC) which can write ring 0 drivers, but I haven't ever
done that kind of work.

Good Luck !

2663. radio mods

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-19 00:00:00 UTC
From: steve@eagle.ais.net
Message-ID: <3s2j2q$nqb@news.ais.net>
Source record: 42850

Does anyone know where I can find a schematic/mod listing for a Yeasu FT-470. Before you go bonkers, I'm not looking to use it for xmitting 9600bps packet, just receiving (it'll be one half of a full-duplex setup).

Specifically, I'm wondering if there is some point within the radio that I can tap for discriminator output.

Thanks,
Steve Schmidt, N3QEM

>site instead? Would appreciate help on locating this zip file. Thanks.

Rich, Brian has moved ethrax25.zip to

ftp.ucsd.edu in /hamradio/packet/tcpip/misc/

It can also be found at

hydra.carleton.cs in /pub/hamradio/packet/tcpip/

While we're at it, here's another change since the article was written.

Terry has move all the AX.25 installation and configuration stuff from NET-2 HOWTO to
the HAM HOWTO.

Also....

A couple of extra files can be found where the AX.25 code for Linux
is located. Jeff emailed me this question....

>hello i am usening linux and have get in to ham radio for a number of years
>and use packet radio and am trying to but up a tcpip or a bbs with linux in
>my area. read the arckel in qst and try it but the ax25028 has a file in
>the code that is not in the file you get from sunacm.swan.ac.UK so i am try
>it with out the file in the code and i will let you now what happens.

Hello Jeff, I see what you mean. Hopefully the following will help.

In the dirctory /pub/misc/Linux/Radio/AX25028 there are four files:

krnl028.tgz
sock.dif
util028.tgz
ax25xtra.tgz

You need to untar krnl028.tgz file into /usr/src/linux per the NET-2 HOWTO guide.

The sock.dif patch needs to be applied thus:

1. Copy it to the directory /usr/src/linux/net/inet/
2. Apply the patch with the following command:

patch -p0 < sock.dif

If all goes well you should see a success message.

Now compile the kernel, follow section 13 in the NET-2 HOWTO.

The util028.tgz file is the utilites file, I untared mine into /usr/local. It will create a ax25 directory.

The ax25xtra.tgz is new, this is the first time I've seen it. Below is the README.patch that came with the file. This file is optional.

AX.25 Callsign file in /proc/net patch
==========

What is it ?

A patch for Linux version 1.2.7 (and it works with 1.2.8) which allows you to see a list of the uids associated with call signs. It may well work with other kernel versions too, but its untested, so.....

Status

THIS IS ALPHA TEST.
THERE IS NO WARRENTY.
Perhaps I'll be able to get Alan Cox to include this in the standard distribution shortly.

How to install it.
---

1) Get Linux version 1.2.7 (or 1.2.8)
2) Apply Alan Cox's AX.25 patches as described in the doucmentation
3) Put the file called ax25ptch.gz in the directory above linux
4) I assume that the directory in which you have installed linux is called linux and _NOT_ linux-1.2.7 (or indeed anything else)
5) type: gzip -d ax25ptch.gz
6) type: patch -p0 < ax25ptch
7) The patch should have now applied itself.
8) Configure and make the kernel in the normal way.

How to use it

This is in addition to the AX.25 instructions and the standard kernel instructions.

You will now see that there is an extra "file" in /proc/net called
ax25_calls. It contains the list of uids and callsigns as set up
with the axassoicate program. The first line shows the AX.25 callsign
policy, if this is zero, anyone may use AX.25 on the configured
interfaces, if this is non zero, only root and those listed in the
rest of the ax25_calls file may use AX.25.

The axassociate program probably needs to be extended to pretty print
a version of this file and do translation of uids to usernames for
example. I have not written an extension to it and it may be a while
before I would have time to do so.

Who wrote it

Steven Whitehouse.

In any case, by effectively shorting (bridgeing to a common point) the tower base and the three guy wires, eliminates the possiblity for ground loops, correct? Bascially, all grounds go to a common point (by the utility meter) and are starred out from there.

I'm going to have to do a little rework this summer. I've been lucky so far!

2669. Short-range cheap radio modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-19 00:00:00 UTC
From: m.salmon@uea.ac.uk
Message-ID: <m.salmon.521.00C9F7BC@uea.ac.uk>
Source record: 42856

I want to have a two way link between a base-station and a mobile PC, with a range of about 100 metres. Speed is not very important (1200 baud would be fine) but it has to be cheap, small and low-power. I know very little about radio, so I'm looking for advice. I was thinking about something like an RC transmitter - would it be legal to send digital data over that band in the UK? Is there any off-the-shelf hardware to do this? (ideally, a box with a serial port and a plug saying "attach RC set here" :-))

cheers

mike.

>Thanks Peter

Hi Peter
here's a really cheap 'n' dirty circuit you could use. It's something
which I experimented with when I was a kid!

Before reading further - this is a circuit of very dodgy safety so
take care with it!

You create what is called a relaxation oscillator using a domestic
fluorescent tube. (I don't know whether you call them that in the
states, maybe neon tubes)
A relaxation oscillator consists of a D.C. supply (just ordinary mains
half-wave rectified with a diode. This is fed through a watty resistor
to a capacitor. You connect the tube across the capacitor. What
happens is that the capacitor charges up to the striking voltage of
the tube, the tube strikes and starts to conduct, it discharges the
capacitor through the tube in an instant giving a bright flash, and
once the capacitor voltage is below the *running* voltage of the tube
it stops conducting and the whole cycle starts again. Without doing
the calculations I can't give you the values but you need to aim for a
time constant of around a second and a capacitor value which will only
store about a tenth of a Joule. I am not even sure whether this would
work on your much lower supply voltage (U.K. is 230 volts)

Sounds horrific doesn't it? But it does actually work after a fashion,
and you can buy fluorescent tubes in all sorts of shapes and sizes.

Have fun but take care

But the gateway station is *not* the first forwarding station. It
is the *originating* station. An originating station can never operate
under automatic control.

>In some cases true, but it could also be operating remote control by
>commands delivered over the Internet. If the station is under
>remote control, it is no longer under automatic control.

Yes, but that assumes that each and every person you allow access
to your gateway via the internet is a licensed amateur operator
with privileges in the band where your transmitter operates, and
that each and every one of them has been previously entered into
the station records as a control operator. It also means that
if someone accesses your gateway from the amateur side, they
can't do Email downloads unless a control operator is present
at the gateway transmitter because that Email is third party
traffic. If you give the amateur side operators control operator
status, then the control channel must *not* be on the operating
frequency, and must operate under auxilliary operation rules
and be part of the system network diagram in the station records
of the remote controlled station.

The way I interpret the FCC forwarding rules, they apply only
to networks of *amateur* stations forwarding messages on radio,
when you throw non-amateur message content or remote control
links into the mix of an *originating* station, you've got
troubles.

Gary

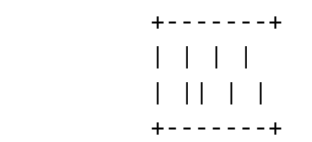
Ham Radio Gurus:

Does anyone know where to get a microphone for the Motorola Mitrek radio? I am refurbishing a Mitrek and it didn't include a microphone when I bought it. I would like to obtain an inexpensive used microphone to help in the testing of this unit. The microphone plugs into the back of the control head with a small rectangular connector having 5 pins in a (sort of) staggered pattern. If anyone has an extras they'd be willing to part with, please let me know and make an offer. Thanks!

Diagram of connector:



73 de N8VEM

Andrew Lynch

PS the local motorola contracted repair shop in Dayton Ohio is not interested in this (I checked) and the other place I tried charges $20 per microphone, but has a $25 minimum purchase (ie, unless they sell me something else for at least $5, they won't take my order!--thats crazy!)

Hi Teh,

tcp/ip can be quite a challenge but well worth it. I'd suggest starting
with NOSView (software) and NOSIntro (a book from ARRL). You can find
NOSView on ftp.ucsd.edu.

NOS by default interfaces with a tnc in KISS mode. To interface with
other devices, such as a LAN card or the Baycom modem, you'll need to
load a driver before starting NOS. You can find the Baycom driver in
a file called drivers.exe. I believe I found it on ftp.ucsd.edu also.

You can fire up NOS withouts2202629@titan.np.ac.sg (Teh Aik Wen) wrote:
connecting to anything and learn a lot about
it. That would be a good way to go. Then add the Baycom driver.

Finally, once you've learned a bit about NOS, then move to other versions
like TNOS or JNOS. While they work a little differently, you'll be
able to figure them out.

Best of luck,

Davek

>
> I live in an area where there are NO TCP/IP stations active (that I know of).
> How does one identify a TCP/IP station as opposed to normal packet?

Run a full packet trace (with a NOS command like 'trace tnc0 211'), and look at the 17th byte from the start of each packet. This is the Protocol ID (PID) byte, indicating the type of packet. In hex, this byte will be:

f0 AX.25 packet
cd ARP packet
cf NET/ROM packet
cc IP packet

If it's a "cc" (IP) packet, then look at the 27th byte from the start. In hex, this byte will be:

01 ICMP packet
06 TCP packet
11 UDP packet
5d AXIP (wormhole) packet

> How do I go about setting up autoexec.nos to use NET/ROM?

See Chapter 29 (pages 251-262) of "NOSintro". It's all in there.

> I have no idea what routes I should be taking to get anywhere? All help
> appreciated. Thanks.

This is possibly your biggest problem. You have to find out what routes already exist in your neighborhood. You have to talk to the locals and identify your nearest accessible NET/ROM node.

> I have the book NOSintro. It does not NOT answer these particular questions.
>

Oh dear, I've failed again ....

I generally concur with Gary's remarks. Another point:

[[Quoting revisions to Part 97 (97.219)]]

(d) For stations participating in a message forwarding system, the control operator of the first forwarding station must:

>> (1) Authenticate the identity of the station from which it accepts
>> communications on behalf of the system; or

(2) Accept accountability for any violation of the rules in this Part contained in messages it retransmits to the system.

[...]

The FCC seems to allow two alternatives to the "first forwarding" stations: either authenticate the originating station or accept accountability for
>> content. Since gateway access is controlled by password and SMTP mail
>> through the router can be blocked, or changed into POP mail (again password restricted to a list of known stations), I'll accept that risk.
The FCC didn't say it wasn't allowed, They said if you do, you are responsible for compliance with the rules. I believe I can ensure compliance with the rules with a combination of controls over the users, and remote control of the station. At least on a gateway, I can deny access to specific stations without affecting other users. (now THAT would be a handy feature on a voice repeater <smile>)

[...]

All told, with the controls I have over the machine, (router restrictions,
>> POPmail) and allowing or denying access to specific users, I am
>> comfortable with operating the gateway under automatic control, even supporting email transport. Just because a system CAN be used illegally, doesn't mean I have to turn it off. As a control operator, I DO have a serious obligation to eliminating obvious risks (no USEnet for example), monitoring it, and taking corrective action when necessary. This is no different than any Ham Radio activity.

In my opinion (and i'm sure that is shared by many systems programmers, system adminstrators and other computer professionals), while passwords may be the generally used method of access control, they are notably insecure and easily forged. At UC Berkeley (and many other places), we have found people operating "password sniffers", code fragments which open ethernet drivers and scan all packets over the subnet for interchanges which look like passwords, and other plaintext authetication methods, and save these away for manual, and sometimes even automatic, examination and usage. In

this neck of the woods, it is a notoriously bad means of access control, for which there is not yet agreement on solutions. I know that if the position that i'm in changes from temporary to permanent, one of the things that i will institute in the next year or so is some kind of challenge and response for non-local users such that someone viewing the exchange in plaintext is reasonably unlikely to be able to make use of this information.

So what does this have to do with amateur radio? Well, if i am to run a node or other software which allows its users to send information either onto RF, directly or indirectly, then i, as the first forwarding station, will insist on properly authenticating that user as another amateur radio. I do not consider plaintext passwords, or for that matter, singular passwords at all, to be adequate authentication to put my license (and my family pocketbook) at risk. They might be adequate for dialup usage, but not if sent via the Internet. I might be willing to access responsibility for third party traffic from close friends who clearly know, understand, and are willing to operate under the constraints of Part 97, but i will not do that for strangers (or those who are not close friends), licensed or not, unless i can definitively show the FCC, or any other responsible parties, that i have made a reasonable effort to authenticate these operators and that they should be held responsible for their actions, not i. Otherwise, i would not be willing to do much more than effectively transport RF input to RF output, in order to qualify as being a "forwarding station in message forwarding system". And still, i would monitor from time to time, in order that make reasonable efforts to become aware of any "violative communications" occuring as other than isolated incidents. This may or may not be necessary, according to how you might read Part 97, but i would consider it to be prudent conduct in the same way that a control operator of repeater would monitors her/his repeater.

If you are running Jnos, when you have trace on you will see packets with IP: info in them. Also if you log onto an ip station it will usually tell you.

I haven't enabled netrom on my system so can't really help there but do know some folks doing that here & could ask. We have a growing TCP/IP network here on the front range of Colorado, from Colo. Springs to Fort Collins but most of the users are running AX25 on 2m.

I've been fighting with Jnos for the last year & have learned a bit about so if you want to email me other questions I'll see if I can confuse you. 73

A friend of mine is looking for a card like the one DRSI used to sell and
labeled PC*Packet Adapter Type 2. It's a dual-port packet radio system
that goes into a PC. Type 2 has 2 1200 baud ports for completely
independent dual port VHF/UHF operation.
Since DRSI doesn't produce that card, does anyone know about a
manufacturer that would be able to supply a replacement to that card?

Please answer directly to F5JTL@unm.edu

Thanks

But that's the sticking point. As a gateway onto amateur radio, you
are *not* the first forwarding station, you are the *originating*
station as far as the FCC is concerned, since you are originating
the message onto amateur radio. Note that (1) above says "Authenticate
the identity of the *station* from which it accepts communications.."
Since any traffic coming from the internet is not coming from an
amateur *station*, you aren't first forwarder, you are *originator*,
and as such, you can't operate under automatic control.

Gary

The internal modem in the Mod 100 is Bell 103, VHF 1200 baud packet
is Bell 202, so that won't work. As I recall, been a while since I
had a Mod 100, there's a cassette port on the thing. It seems like
it would be possible to write assembler software to bit-bang that
ala Baycom, to do VHF packet.

Of course with a TNC, the built in terminal firmware works fine,
and is the way I used mine.

Daer OM's

I'm looking for a program to monitor packet activity on a channel
ONLINE. Who uses/knows a program able to display an unlimited
MHEARD-list and statistics for the stations on channel like the number
of frames send (connect-frames, I-frames etc).

I use a PK-88

Thanks for any info,

Douglas (holland)

The TAPR 9600 bps modem kit ($80.00) will work fine with a PI card. See
www.tapr.org or ftp.tapr.org for more information or call 817-383-0000 (FAX
817-566-2544).

Hi,
Check out the 2Mbps/10Ghz data link described in the ARRL Handbook a few years ago. I think it was in 93 or 94. With line of sight paths and small dishes, you should be able to do 40 miles or so.

The RF stuff is pretty easy to build up. You can get away with using surplus Gunn transcievers that show up at hamfests for like $15. You need to build up a modulator/PSU, and an IF with AFC. It's all described and pretty simple too. You'll end up with a full duplex system.

The interface to these is a 15pin ethernet AUI connector.

I'd like to do the same thing here but am having trouble getting anyone else in the area in on it. So in the mean time I've been playing with WBFM on 10Ghz, and doing 2400baud IP on 2 meters. :(

>So what does this have to do with amateur radio? Well, if i am to run a
>node or other software which allows its users to send information either
>onto RF, directly or indirectly, then i, as the first forwarding station,
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>will insist on properly authenticating that user as another amateur radio.

But that's the sticking point. As a gateway onto amateur radio, you
are *not* the first forwarding station, you are the *originating*
station as far as the FCC is concerned, since you are originating
the message onto amateur radio. Note that (1) above says "Authenticate
the identity of the *station* from which it accepts communications.."
Since any traffic coming from the internet is not coming from an
amateur *station*, you aren't first forwarder, you are *originator*,
and as such, you can't operate under automatic control.

Agreed in principle, and also because i'm not clear what the Commission is
really requiring, as i think we may have a grey area here, i later took
the position:

>... Otherwise, i would not be willing to do much more than effectively
>transport RF input to RF output, in order to qualify as being a "forward-
>ing station in [a] message forwarding system". And still, i would monitor

I can't tell what they really mean there [97.219], and without being able
to see the administrative equivalent of the legislative history (if such
even exists), i'm certainly not going to stick *my* neck out. Sooner or
later, someone else will, and that section will get tested, and then i
can act on the results of that. Or some respected organization like the
ARRL will request language clarifying this point. Meanwhile, i would
strongly suggest that one be very careful if one is considering offering
this service, as i view it as quite problematic.

Yes, but that assumes that each and every person you allow access
to your gateway via the internet is a licensed amateur operator
with privileges in the band where your transmitter operates, and
that each and every one of them has been previously entered into
the station records as a control operator...

That's an interesting approach.

... If you give the amateur side operators control operator
status, then the control channel must *not* be on the operating
frequency, and must operate under auxilliary operation rules
and be part of the system network diagram in the station records
of the remote controlled station.

I would presume that this is more like station under remote control
via some kind of 'land line', where frequency doesn't really mean very
much. If the information being sent comes from RF, then it probably
doesn't need to be considered as remote control, and won't be subject
to those restrictions. It is an interesting approach...

The way I interpret the FCC forwarding rules, they apply only
to networks of *amateur* stations forwarding messages on radio,
when you throw non-amateur message content or remote control
links into the mix of an *originating* station, you've got
troubles.

I agree that this is difficult, at best, and might get one into trouble
given the uncertainty as to how the rules will be interpreted.

On the other hand, if such a gateway can definitively determine that it's
beyond the first forwarding station, then i would appreciate it if such
nodes were less restrictive. Unfortunately, many nodes, particularly of
the JNOS variety, are apparently either unable or unwilling to make this
distinction.

Hello Ibrahim, here is the info you're looking for as far as NASA news.
I don't have the Keplarian elements mail list address but will find it and
post it here for you.

NASA NEWS:
NASA press releases and other information are available
automatically by sending an Internet electronic mail message
to domo@hq.nasa.gov. In the body of the message (not the
subject line) users should type the words "subscribe press-
release" (no quotes). The system will reply with a
confirmation via E-mail of each subscription. A second
automatic message will include additional information on the
service. Questions should be directed to (202) 358-4043.

Currently, all I own is a 2 meter HT, and an outside antenna.

I would really love to get on packet.

What I would like to find out is what can I get into that is real cheap
just to get started?
I dont care if its 1200 baud to start with, even though im sure ill go to
9600 later, and hopefully maybe higher if possible.

If there is something that works and works at 1200+ for around 50 bucks or
less, that would probably be great.

I am even open to kits...

I eventually will end up getting a multi-mode controller when I get an HF
radio, but for now im just saving my money for the HF radio!

Please help -
Thanks in advance!

Running JNOS110j on a 286 and 486 and I cannot get it to receive data from the tnc. It seems to transmit my ID Okay, but nothing is received, not even when I set tracing on. When I run KA9Q's NOS, everything works okay. My autoexec.nos for jnos is about the same as for NOS except that the commands that JNOS does not use are removed.

Does anyone have any clues to why JNOS does not receive? I have gone through all of my doc's searching for an answer.

2725. What is the least expensive way of getting Linux up on packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-23 00:00:00 UTC
From: negaard@draagen.graceland.edu
Message-ID: <NEGAARD.95Jun23115622@draagen.graceland.edu>
Source record: 42812

I'm a fairly recent licensee (got my ticket in December), and I've
been exploring the principles of packet. I'm _really_ interested in
TCP/IP, but far from disinterested in other modes. My inquiry is as
follows:

I'm on a _tight_ budget. I'd like to get on packet using something in
the same price-range as a baycom (a baycom would be _fine_). I'd also
like to do it without booting DOS (I'm trying like mad to avoid that).

I've got the latest Linux kernel (1.3.3) and have compiled it with
everything even remotely packet-related included (IP-forwarding,
IP-multicast, IP-firewall [in case I get a chance to run a gateway],
AX.25, NetROM, SLIP and CSLIP, PPP), and now I want to know what the
most affordable modem/TNC option is for 1200 bps packet.

Is there a Linux program that does what the Baycom software does,
allowing me to just use a modem (and radio, of course)? I'll be using
my RS HT, so 1200 bps is all I need for now. Is there a home-brewable
modem that will serve my purposes?

Or, is there another inexpensive alternative?

Any and all help appreciated!

Make sure that you have
param port dtr on
param port rts on
where port is the name of the port. If you don't set these to on, JNOS
will Xmit, but not receive.

Actually noticed this by misstake, once it was a good misstake.

> For your info:
> Whe do have an fast running network in The Netherlands on CB, with
> forwarding to Danmark Sweden Germany Belgium.

Could you tell more? How fast? (Propably faster than our HAM-PR-net here :)

> Danmark and Sweden are done by thelephone 4ward every day, and Belgium and
> Germany are done by packet.

That telephone sticks in my eye; I don't like it. It's expensive (?) and it's
somehow too easy..

>
> FBB is writen for amateurs, but we are also amatuers !!!!! we do also like

> amateurs, but the interest in radio's is the same.

Good point! Didn't think of that..actually what I'm every day doing I could
propably do it on CB and propably more (with internet gates)...I hardly
experiment with RF techniques, I like more what I can do with the keyboard
of my PC.

Well, then I have the possibility to do something else..

> As i can see here in the Netherlands, a lot of registrated amateurs make use
> of the experimenst done by CB people like building modems for higher
> baudrate's, or DCD.

Do you have actually more than 1k2bps on 27 Mhz ? If, then normal AFSK (well,
maybe not normal for everybody).

> So as i said again we are also amateurs, but only on the CB-band.

If some nut-head here in Finland comes with an idea to restrict the minor
(due to our regulations) internet gateways I will propably look to changes
on CB (hope the requlations or the peolpe who are reading them are then
lighter for CB - well, of course ham-req.s should come first :)

> We even do have an PACKET<>INTERNET mail gateway :-)) so we can also send
> message's forwarded by FBB to the station who is runnig the gate, and there
> it will be send on internet.

We (and those Big-Hats on the other continent) have also gates. The requlations
are the first brake; it's like running on the water.

> I even think the "LEGAL" amateurs are very interested how it is done to make
> such a gate running :-)), and i can tell you it works hi.

I hope I have some day enough will to read the TCP/IP / NOS -DOC through..

Hello,

Where could I find PC/FlexNet?
- FTP-site?
- Landline BBS in Europe? (with V. FC 28k8bps)

Runs it with TNC2? In kiss-mode?

Is there newer than 3.3c?

Also interrested in TheNetNode, saw somewhere 1.55 is there newer? With docs?

(Deutsch geht auch)

PSE also a reply in case I miss the follow-up.

2731. Help, Have HP200LX palmtop, and Baypac TNC, How to set up????

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-23 00:00:00 UTC
From: umy@u.washington.edu
Message-ID: <3sfj8h$da9@nntp4.u.washington.edu>
Source record: 42818

Help, I have a Hewlett Packard HP200LX palmtop, and a Baypac TNC modem. I'm running HP's F1015-80002 Serial cable from the 200LX into a Radio Shack DB-9 to DB-25 converter. From the converter I'm plugged into the Baypac TNC. I'm running a Kenwood TH-28A HT for a radio. The whole thing works on my Compaq Laptop, but doesnt run on the HP. The HP setup does let the rig transmit, however for only a micro of a second. Also, the Recv does not indicate in the Baycom program window, however Send and QRV do indicate. What am I doing wrong?

Thank you in advance,

Darrell KB7ZTK

SS>If there is something that works and works at 1200+ for around 50 bucks or
>less, that would probably be great.

SS>I am even open to kits...

Sounds like you want a Baycomm modem. They can be had for around $50
+/- $10. and is also available as a kit. All you need is a PC because
the TNC functions (the AX.25 stuff) is done in software.

Look in the back of QST and you'll find the add for them. I've seen the
kit at hamfests too. I think it's sold by Ramsey.

Keep in mind though that a hardware TNC is only about $50 more. This is
a much better way to go. Something like a KPC-3 can be had for around
$110.

I am looking for information on a system that would allow a client station to connect to a host station, have the host station dial a phone number, and then gateway phone data to packet data. The result would be the ability to call a land line based service provider (read BBS) from a rig in the field. I am calling the arangement a digital autopatch until I know better...

Does this exist yet? Does it have a name? Where could I learn more about it if it does exist?

Anyone want to theorize what sort of equipment/protocols/software would be needed for such a thing if it doesn't exist?

>distinction.

Yes, that's an issue the software writers need to address. Since the rules are different for originator, first forwarder, and everyone else, it's incumbent on the software writers to handle the differently routed messages differently.

That's really a problem for TCP/IP systems, though, since they are "connectionless" at the IP level where routing is done. Perhaps the TTL field could be used for this purpose.

This is all a really nasty problem, and one the FCC should have addressed, via Karn's petition, but they refused to do so. They seem to still be stuck in a BBS paradigm while we're dealing with end to end and packet by packet routing and relay. Perhaps we can make them think these are just digipeaters. They seem to "get" that idea.

2743. Problems with G8BPQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-25 00:00:00 UTC
From: skrol@inter.nl.net
Message-ID: <DAq5n9.6Kv@inter.NL.net>
Source record: 42830

Haai there,

I've a few questions about the G8BPQ netrom program :

1) When I set the maxframe in bpqcfg.txt at 1 frame at a time it still
sends more than 1 frame?? That's when having only one link. When
ther're
multiple links it sends even more than 7 frames!

2) Why is G8BPQ sending directly a poll-bit when transmitting for the
first
time?? I see always : 'ctl I65+' instead of : 'ctl I65^'.
A friend of me sais that it then overrules the response time and so
corrupts the protocol??? G8BPQ becomes more agressive by it.

Can someone give me a hint??

Greetings,
Sjoerd.

From: skrol@inter.nl.net
Message-ID: <DAq5pp.6Mo@inter.NL.net>
Source record: 42832

Haai there,

Is there a possibillity to decrease the maxframe of tcp/ip links?
I'm working with jnos 1.10j and can only find a command to set the ax25
maxframe. With a very good link, I got a maxframe with tcp/ip of 11!
I think that's to many, because you'll be sending for about 10 sec
at once (128 bytes paclen and 1200 bps interface).

Greetings,
Sjoerd.

2746. parameter maxkey in Jnos110j??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-25 00:00:00 UTC
From: skrol@inter.nl.net
Message-ID: <DAq5rp.6o6@inter.NL.net>
Source record: 42833

Haai there,

If I want to use the parameter 'maxkey', which should be supported in
jnos 1.10j (if the docs and helpfile are correct), I get the message :
'parameter maxkey not supported'. According to the docs, the parameter
maxkey
sets the maximum time for the transmitter to be keyed (maximum time that
it
will be transmitting, if I understand it correctly). The command I give
is :
param <iface> maxkey 5000 (5 seconds transmitting time).

Am I doing something wrong or did I forget to compile something in??
Or do I have to use numbers instead of the word? When I'm using the
command :
param <iface> 6 5000 jnos displays : 'Hardware 5000'
Normaly I use parameters 1-5. Jnos display the following when setting
them
with 'param <iface> <number> <setting>' :

number : displayed text :
1 Txdelay <setting>
2 Persistence <setting>
3 Slottime <setting>
4 Txtail <setting>
5 Fulldup <setting>
6 Hardware <setting> (I don't know what this parameter does,
but maybe it's the maxkey
parameter???)

Can someone give me an answer on this????

Baycom-type hardware needs *very* strict timing - the HDLC decoding is
done in software and the datastream must be sampled at a very high rate.

Multi-tasking operating systems like Linux, OS/2 or windoze can't give
this kind of resources to a single device - all the other processes would
stop.

Some people here are using Linux with an ISA plug in board containing
8530 scc chips. This works nice , using various NOS versions or the embedded
networking facilities of Linux. The networking facilities of Linux is not
very well suited to use over relatively slow amateur paths, however.

8530 boards for the pc: the ottawa PI card, DRSI card, PA0HZP OptoPcScc card,
and many others. Here is Holland we use mostly the PA0HZP card.

I'm still looking for people interested in attending a digital frequency coordination meeting, in conjunction with the summer SERA board meeting, in Knoxville, the weekend of July 22/23. This would be primarily for packet system operators in the SERA states (NC, SC, VA, WVA, GA, AL, TN, KY).

Interested? Let me know who you are, and I'll forward details.

skrol@inter.nl.net (Sjoerd Krol) wrote:
>Is there a possibillity to decrease the maxframe of tcp/ip links?

When sending IP via AX.25 UI (unconnected) frames, the AX.25 maxframe parameter doesn't apply. What you can do instead is reduce the TCP "window" parameter. That will act somewhat equivalently to the AX.25 maxframe parameter, although on a connection-by-connection basis. If you set the MTU of your packet interface to 256, resulting in a TCP MSS of 216 (if memory serves), the maximum number of TCP packets normally sent at one time will be (window/216).

Of course, if you have more than one TCP connection ongoing, you can end up with (window/256) packets to transmit for each connection...

Oh, and a change to the window only affects subsequent connections, not connections already established.

Of course, if you are using connected-mode AX.25, maxframe should work.

: Baypac TNC. I'm running a Kenwood TH-28A HT for a radio. The whole
: thing works on my Compaq Laptop, but doesnt run on the HP. The HP setup
: does let the rig transmit, however for only a micro of a second. Also,
: the Recv does not indicate in the Baycom program window, however Send and
: QRV do indicate. What am I doing wrong?

I had a similar problem on my 100LX, but I kind of knew what I was seeing.
You need to use the cable adapter with the phone on it. You need to switch
pins 2 & 3. That should get you going.

> command but after NOS say BE VERY CAREFUL with a series of numbers.....
> I don't know what I have to answer, probably a password but I haven't set
> one for this purpose.... Can somebody help me ?

*** Step 1: Set up FTPUSERS. e.g.

```
-----------------------------------------------
superuser supasswd /public 67
-----------------------------------------------
```

The username "superuser" must be at least 7 characters
long (to prevent AX.25 users with 6-character callsigns
logging in without giving a password).

*** Step 2: Set up the remote password (max 30 characters)
in AUTOEXEC.NOS. e.g.

```
-----------------------------------------------
mbox password "This is my password string."
-----------------------------------------------
```

*** Step 3: On a piece of paper, write out the mbox password,
and number each character (starting at zero):

```
-------------------------------------------------------
1 1 1 1 1 1 1 1 1 2 2 2 2 2 2 2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6
T h i s i s m y p a s s w o r d s t r i n g .
-------------------------------------------------------
```

When you log in as remote sysop, the mbox will give you
five numbers. You have to respond with the corresponding
characters from your piece of paper: e.g.

```
-------------------------------------------------------

Mbox says: 22 21 18 2 12
You reply: r t d i a
-------------------------------------------------------
```

You can reply with dummy lines if you want to fool the snoopers.
Terminate the input with 2 CRs. If one of the lines is correct,
you will get access.

I'd like to order the parts needed to upgrade a number of TNC-2
to operate at 9.8Mhz. I know a 10Mhz parts kit is available;
however I'd like to try to reduce the overall project costs by
purchasing the parts myself.

The crystal and EPROM are no problem, but I don't know of sources
for the 10Mhz CMOS Z80 CPU and SIO chips.

I found one catalog that listed the Zilog chips, but under their
Part Number scheme. When I asked the person if he would go look
at the chips to determine which was the 10Mhz variety, he admitted
they didn't have any in stock anyway!

Perhaps I'm just not accumulating the right catalogs these days.
Can anyone recommend where I can purchase the 10Mhz Z80 parts?

Thanks and 73 ---> Dave Zeph (zephd@iquest.net)

If I recall correctl, the 6300 is an 8086 based machine. You should be able to run any of the
NOS flavors as long as it is compiled for the 8086. I know the JNOS distribution has this option in
the makefile.
Hope this helps - Jerry - N1SJQ

2761. re: Digital Autopatch

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-26 00:00:00 UTC
From: tvr@les.CNMAT.Berkeley.EDU
Message-ID: <TVR.95Jun25190318@les.CNMAT.Berkeley.EDU>
Source record: 42836

I am looking for information on a system that would allow a client station to connect to a host station, have the host station dial a phone number, and then gateway phone data to packet data. The result would be the ability to call a land line based service provider (read BBS) from a rig in the field. I am calling the arangement a digital autopatch until I know better...

This is not a technical problem, it's a matter of Part 97. The gateway station would be sending Third Party traffic and that can't, in general, happen unsupervised. But if the RF station can supply a phone number, then you've got a serious problem here. It's an interesting idea, but the problems are just as bad as trying to connect the Internet (of which there has been considerable discussion). When that issue has been adequately addressed, then this one probably will be, too.

Does this exist yet? Does it have a name? Where could I learn more about it if it does exist?

No demand, for the above reasons.

Anyone want to theorize what sort of equipment/protocols/software would be needed for such a thing if it doesn't exist?

It's probably not a difficult programming problem, and can be done with most machines which support both dialing out and packet, and which give the programmer adequate control over these facilities.

To summarize, the programming problem is trivial compared to difficulties with Part 97. You might be able to access a BBS which only takes postings from RF, but you won't ever see general access until the FCC sees things differently (in my opinion).

-- KD6PAG (networking old-timer, RF newbie)

P.S. I can imagine a restricted digital auto-patch specifically for deaf hams to access the TTY-to-voice gateway that our local phone company provides, as well as a list of comparable TTY numbers intended only for deaf users. This would be comparable to a local repeater which has conventional auto-patch codes to access emergency services. This an obvious extension: the ham, by way of explanation, and by being in control of a low-speed interaction with another human, could, in a manner analogous to a conventional auto-patch, immediately terminate the interaction if the other end does not comply with Part 97. If a computer is at the other end, it does no good to explain the rules, as there's no way it can be expected to comply. Now, if the computer were able pass the Turing Test...

2762. 9600 bps modem question

Newsgroup: rec.radio.amateur.digital.misc

maxframe is set with the ax25 maxframe command as you indicate.
it can be set to any number between 1 and 7. If jnos allows numbers
larger than 7, then it has a bug. The maxframe should be set to 1 for
half-duplex, and up to 7 on full-duplex.

This has nothing to do with tcp/ip, but all ax.25 links.

2766. TAPR DCD mod. and PK232MBX.

June 26, 1995

While I have enjoyed, in limited doses, some of this music?, I
sincerely hope NOT to hear it 60 feet down on a reef!

We divers do all we can to avoid crash-dancing with the reef, sharks,
conch, each other, etc.

Surface noise has its place, but NOT on a reef.

Enjoy,

Robert Keeney

Folks - re-posting to a spam does nothing but lengthen its life. You want to do something about the spammers (and I'm all for that), contact postmaster@wherever.com. The big online services (aol, prodigy) seem to produce the most spams (probably because they have the most users, and many of those are fairly clueless :-). The good side of that is that those big online services also respond very quickly to spamming problems originating inside their walls.

The current one we're dealing with did *not* originate there - it came from a site called "ixc.net", which means nothing to me, but I'm going to send an e-mail to the postmaster@ixc.net, just in case.

Regards, Lee

If it's DOS, then you want JNOS. The current version is 1.10J I
believe. Try the UCSD site: ftp.ucsd.edu.

I bought a TNC2 some days ago and now would like to start Packet. I know
some good prog's for PC, but I have an old AMIGA 2000 and do not know what
to do with that thing, so I thought it would be the perfect packet machine.
I wonder if there are any good packages for Amiga, and if there are share-
ware programs to test my TNC with the machine...

I now find out that the actual problem is that trace does not work.
It does receive okay, but nothing is displayed on the screen when
trace is on. (trace tnc0 111). Works fine on nos. So my question
now is why does my trace not work?

>73 de Bill B., KC7JSD

The Baypac is NOT a TNC. It is only the modem part of one. It does not communicate with the PC over pins 2 and 3, the normal transmit and receive data pins. These pins can be left unconnected for all the Baypac cares. Sometimes pin 2 is used for power. Data is transferred to the modem using DTR, pin 20 for Transmit Data, and CTS, pin 5, for receive data. The synchronous data from the modem is framed and decoded by the Baycom software, L2.EXE (This program does the work of the rest of a TNC). The asynchronous port is used as a bit timer, by setting it to a high baud rate, and outputting bytes to the (unconnected) transmitter to generate periodic interrupts. Because the port is used in this unconventional manner, it must be fully PC compatible (8250, etc. equivalent) I do not know if the HP machine in question is capable of this. If it is, a similar problem could be noticed if the port is set improperly in SCC.INI.

Troubleshooting:
Disconnect the modem and measure voltage at pin 4 of 25-pin connector from the computer (Ground is pin 7) If near 0 volts, a cross-over cable like Bill mentioned is required. Should be - volts when receiving and + volts when transmitting (status line shows SEND)

If always - volts, then check port setting in SCC.INI (I think the parameter name is RS232). If it switches from - to + to transmit (with modem connected, radio should key), but still nothing is received, port/ computer may not be compatible with Baycom. Also some Baycom modems do not output full RS232 signal swing, making reception impossible on some computers, but transmission OK. I don't know if the Baypac is one of those.

I have tried everything I can think of to get Paket 6.1 configured
so it will properly decode the stream switchs. It just refuses to
do the stream switching. All data, HF or VHF gets plastered into
one big mess on a single window. I'd like to use this program
since its much better than the awful Hostmaster-II, but I can't see
spending the mony on registering it if it aint gonna work!

Paket's manual gives the allusion it should work but no hard facts
I can find. Does anyone have this same problem? If you have an answer
please share. I don't want to register for the support and then be
told to rtfm.

2783. Linux 1.3.3, AX.25 and Thor RLC100 card.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-27 00:00:00 UTC
From: Richard Lamont <richard@stonix.demon.co.uk>
Message-ID: <DAun46.4G7@stonix.demon.co.uk>
Source record: 42770
Cross-posted to: comp.os.linux.networking,rec.radio.amateur.digital.misc,uk.radio.amateur

Has anyone got the kernel z8530 driver to work with a Thor RLC100
4-port HDLC card yet?

It seems to be very nearly there: I can send and receive control
and information frames through it, but with difficulty. The problem
is that it seems to be very slow to ack frames, and when it does
ack them it is behind: i.e. it says it's ready for frame 2 when
in reality it is ready for frame 3. In practice the connection
is so slow that the other end retries out and disconnects.
(This is using 'call'). There is no RF problem here: the frequency
is uncongested and all the equipment has been lined up with
calibrated test gear. And fiddling with Level 2 params is not the
answer. (I'm using neither Net/Rom nor IP.)

While this is happening, a whole load of messages get written to
/var/adm/messages, like this:

```
Jun 26 19:36:11 stonix kernel: sl0: transmit timed out, driver error?
Jun 26 19:36:34 stonix kernel: sl0: transmit timed out, driver error?
Jun 26 19:37:04 stonix kernel: sl0: transmit timed out, driver error?
Jun 26 19:38:17 stonix kernel: sl0: transmit timed out, driver error?
Jun 26 19:40:34 stonix kernel: sl0: transmit timed out, driver error?
Jun 26 19:44:02 stonix kernel: sl0: transmit timed out, driver error?
Jun 26 19:44:43 stonix kernel: sl0: transmit timed out, driver error?
```

Exactly the same thing is happening with 1.3.3, compiled with gcc-2.6.3
and libc-4.7.2, as happened last time I tried it with 1.2.8, kernel-029,
gcc-2.5.8 and (I think) lic.4.5.26.

The card is not one of those supported by Joerg Reuter's code, so I
guess the driver needs tweaking to suit its idiosyncracies. Anyone
got there yet?

Dave,

There is a Kenwood "Application Note" number AAN-0010 available
from Kenwood on the data connector pinouts of the TM733A.
Darn, I used it for making up cables to connect to my KPC-9612
TNC, but can't find the PTT reference.
Here's the info in the document:

PIN# PIN NAME FUNCTION

1 PKD PACKET DATA (Input)
- Transmit audio data from the TNC to the xcvr

2 DE DATA EARTH - Ground for TNC transmit audio line

3 PKS PACKET STANDBY
- The TNC/Data device can use this pin to inhibit
the xcvr mic audio input while transmitting
packet/data signals

4 PR9 FM DEMODULATOR OUTPUT
- For 9600 BPS operation only
- Output audio level: 500 mVp-p @ 10 kohms load.
- You must activate the 9600 BPS function on your
radio for this pin to become active. See the
instructions in operators manual for details.

5 PR1 FM DEMODULATOR OUTPUT
- For 1200 BPS Packet and RTTY operation
- Audio output is taken before the VOL control
(Volume control has no effect on output level)
- Output audio level: 300 mVp-p @ 10 kohms load.
- This is the standard output pin. No signal will
present at this pin if you have activated 9600.

6 SQC SQUELCH CONTROL or Relay Output (TM-255/455)
- Squelch control
- Inhibits TNC data transmit while the xcvr squelch
is open. This prevents interference to voice

communications on the same frequency and unwanted
retries.
- Output level:
Squelch open: +5Vdc (High)
Squelch closed: 0Vdc (Low)
- Relay Output (TM-255/455)

The additional circuitry is not too bizarre - there is a "randomizer"
circuit used in the most commonly available 9600 baud modems, i.e. the
G3RUH, TAPR, K9NG, and the major manufacturers' TNCs also have it. I
can't point you to an electronic version of the schematic for the
randomizer - perhaps someone else knows where to find it.

>

While it's not required to have the "PK-232 Modem Disconnect Header Kit" to install the DCD kit in the PK-232 (or MBX), as an owner of both (and a TAPR 9600 baud modem kit) I'd recommend getting the Modem Disconnect kit along with the DCD kit.

Why, you ask?

The Modem Disconnect Header Kit is a 'plug-in' board that goes in a PK-232 (or MBX). One of the features of the board is that it has a row of through-holes that exactly match the row on the DCD kit. So you can either use a ribbon cable or do as I did.

What I did was to cut a 16-pin wire-wrap chip socket down the middle length-wise. This gives you two 8-pin sockets with long, solid leads. Install one on the modem disconnect board, and cut off the excess pin material. Install the other half of the socket on the DCD board. DO NOT cut the pins (unless you need them a bit shorter). The DCD board will now plug into the modem disconnect board. The modem disconnect board plugs into the Z8530 socket (U6) and the Z8530 chip plugs into the modem disconnect board. The only wires you need are if you decide to implement the DCD LED connections for the DCD board's LED output. The rest just plugs together (and unplugs if you have to troubleshoot, etc.). I also used a pin header for the LED wiring and mounted the new DCD LED to one side of the bar graph, so it can be seen through the window. This allowed me to keep my "original" PK-232 (serial #10) looking like original - no extra holes, etc.

Another potential benifit - if you decide to add the TAPR 9600 baud modem in the future, you'll already have the modem disconnect header kit in place.

Also, the wiring kit offered for the 9600 baud modem does not fit an early-design PK-232 board. If your PK-232MBX was not built with a battery disconnect jumper accessable through the >bottom< of the case, then your main board is of the original design, and the wiring kit won't mate up right.

How do I know all this? Well, I did customer service for AEA for over 4 years... And I'm the original owner of PK-232 #10 - so I've had one for almost 9 years.

Hope that helps, and 73

Bob

Ever consider that an e-mail message to the spammer from EVERYONE bugged
by it would FLOOD their e-mailbox?... and no one else has to be subjected to
it either... I have gotten fairly good response to postmaster@wherever.com
messages but I approach them very politely as they are easily offended as if
you might be blaming them.

hi,

There is a great program called 'Amicom' for the Amiga. Actual version
is 2.1a and you can FTP it from any Aminet site in Aminet:misc/sci/Amicom21a
(filename may differ a bit). (try ftp.uni-paderborn.de in germany)

Hope you like it... it looks a lot like GP on the PeeCees...

2816. How can I Identify a Packet Routing Problem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-29 00:00:00 UTC
From: smiller@intelsun.rus.uni-stuttgart.de
Message-ID: <3su0iu$15eg@info4.rus.uni-stuttgart.de>
Source record: 42703

I have exchagned a number of packet messages between my home here in
Germany and three hams in the U.S. For the most part it has been pretty
reliable. However, in recent months my friends and I have experienced
the following:

Packet Messages from Stuttgart -> Portland, Oregon: 100% success.
from Portland -> Stuttgart: ~90% success.
from Stuttgart -> Las Vegas: 100% success.
from Las Vegas -> Stuttgart: 100% success.
from Ontario, Oregon -> Portland: 100% success.
from Portland -> Ontario: 100% success.
from Ontario -> Las Vegas: 100% success.
from Las Vegas -> Ontario: ~90% success.
but from Ontario -> Stuttgart: 0% success.
and from Stuttgart -> Ontario: 0% success.

In virtually every case that a message was attempted to be sent between
Stuttgart, Germany, and Ontario, Oregon, the message never arrived at
the destination nor was returned to the sender. Except once, when I
sent a message from Stuttgart to Ontario the message was returned as
undeliverable after about a week. (Note: A year or so ago I successfully
exchanged messages between the same source/destination PBBSs in Stuttgart
and Ontario, so something must have changed since then to break things.)

So, there seems to be a routing problem -somewhere- between Germany
and Ontario, Oregon. Since my messages make it to Las Vegas and Portland
OK, I suspect the problem is also somewhere inside the U.S. -- perhaps
even near the Ontario, Oregon node, though messages between Ontario
and Portland and Las Vegas get through fine.

How can I further troubleshoot the problem and identify -where- the
messages are getting lost? Any help would be greatly appreciated.
I'd like to be able to pinpoint the problem and advise the applicable
SYSOPS.

```
Release Notes - IM/Mac 1.0b28f

Written by Ivo Van Ursel, ON1XK
Copyright 1991-1995, Ivo Van Ursel

IM/Mac is copyrighted freeware software. Copies of IM/Mac may be freely
distributed for non-commercial purposes, provided copies of this Release
Notes file and IM/Mac are included together in unmodified form.
Commercial distribution, including distribution on compilation CD-ROMs,
must be done under license.

- Typing a special address like 'remco%utr.pa3fym@pi8rni,remco' does no
longer crash IM/Mac.

- Corrected a minor unBinHex problem: when a message contained only a few
lines of a larger BinHex file, the unBinHex code would try to decode the
file over a length equal to the sum of the data fork and resource fork of
the original file. This not only lead to a CRC error but took much more
time than necessary since non existant lines were decoded. Such a situation
now gives an 'end of file' error.

- When unBinHex fails no longer a file remains in the invisible 'Temporary
Items' folder.

- BinHex coded messages over 64k in length did not decode reliably.

- The Outbound Mail window was not updated correctly after a new message was
sent.

- Added 'open' resource to application and 'kind' resource to preference file.

- 'Fwd: ' is added in front of the subject when a message is forwarded.

- The AppleScript command 'activate' did not bring IM/Mac to the foreground.

- The message size was 10 bytes short after being read.

- Disabled default buttons (usually the 'OK' button) use a blended gray on
color systems.

- Made it pass through the Think C 7.0.4 compiler (thank you Adam!).

- Added an option to delete a file when sent (this item does not have a
help balloon yet).

- Removed a longstanding issue in which all processing comes to a halt when
an IM/Mac notification shows. The notification is removed after 1 minute
only when a dialog shows.
```

- Outbound messages are stuffed only once and the temporary file is only deleted when all destinations are served.

- Sending binary files to more than one host resulted in a corrupted date and time in the second and following outbound message.

- Made it pass through the Think C 8.0 compiler.

- ISO 8859-1 transliteration menu item did not have a help balloon.

- MacsBug installed on a pre-system 7 Macintosh was not detected.

- Under System 6.0.x, desk accessories can be launched in IM/Mac's partition by opening them with the option key held down. Doing so did crash IM/Mac once in a while with an address error.

- Trying to print (or Page Setup...) with no printer selected (e.g., a fresh system software installation) resulted in a crash.

- StuffIt Classic segments have a filetype of 'SegM'. Those were not in the list of filetypes not to compress.

- Changed the color of Stop, Note and Caution icons.

- Very long pathnames confused the edition of the 'bm.rc' file. Such strings show with an elipsis character in the middle. Of course that character should not be stored in the file like it did before.

- Made it compile with 'MW C/C++ 68K 1.2.2' and corrected flagged errors. IM/Mac's soure code is not yet fully compatible with MetroWerks Code-Warrior 6 since the BinHex function was implemented in 68k assembler.

- Added 'CNTL' resources for scrollbars and removed embedded code.

Tuesday, June 20, 1995 - 19:43:46 UTC

PS (by PA2AGA)

This version obsoletes all versions of info-mac/comm/radio-im-mac in the Sumex-Aim.stanford.edu archives.

The new IM/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

New versions of APRS have been on ftp.tapr.org for a long time. The author of the software (who has just learned how to ftp!) is now uploading upgrades to this site. So I'd say that this would be the place to find the most recent version.

Also, there are various maps and other APRS utils. here including the MAC version of APRS.

: >> Any and all help appreciated!

One other thing you might consider is the use of an old modem, such as a Smartmodem 1200 or other old telephone modem that will run at 1200. I've seem some postings on using these, and may have a copy in a file somewhere if you're interested. From my quick scan, nothing really has to be done to make them work. The only possible problem seems to be that most of these old modems are powered from a wall adapter, but it _might_ be possible to convert to battery power.

>=ference to the radio, so much that I have to turn the squelch up and
>=that practically renders the packet rig useless.
>= Is there something that I can do to help this?
>=
>=thanks much,
>=Chris
>=cbremmer@fergus.cfa.org

1. Buy a shielded RS-232 cable for the dumb terminal (or the 486).
2. Snap-on ferrite chokes for cables (buy at radio shack) go on
the tnc-radio cable.
3. Ring (aka - torroid) ferrite chokes for radio/tnc power
cables (ring is better than snap-on as you can wrap the
power cord several times through them). Also at Rshack.
4. Ground the computer case of both machines.
5. Add internal shielding to the 486 (as needed) and grouse
at the manufacturer (plastic case??).
6. More extensive addition of filter caps to the tnc or radio.
7. Blame it on the neighbors TV set. 8=)

Well, yes, if you want to fiddle around a bit, there is supposed to be
a way to interface NOS to a Waffle board, so you could make Internet
news and email available to other users with the ability to edit
incoming and outgoing traffic.

>Can I run some kind of wormhole, etc - what do i need? Getting an MX record
>on the system who actually supplies me the feed is next to impossible. Can I
>get an MX record somewhere else?

>Is there a machine out there who can supply mx records for hams using the

If you're looking for domain.txt, you should be able to pick up a copy
from someone in your area. It is just a text file.

From: rrross@aol.com
Message-ID: <3stdm9$s11@newsbf02.news.aol.com>
Source record: 42711

I have used my YAESU FT 470 dual bander HT with good success with my KPC-3 tnc and Lap-top.

I doo agree, however, that a more powerfull mobile rig would be a better choice for packet.

If you are going to do portable packet from a brief case though (like I like to do)
then an HT is the only anwser and it works acceptable well thru digis.

There is a packet program called APRS that not only alloows contact on vhf and HF but also tracks the person in question ANYWHERE IN THE WORLD.

You can always see his EXACT reported position on your map on your computer screen.

GPS recievers are typically used for the position reporting but they are not nessary if the person knows his current lat and lon position at reporting time.

If you would like to know more about this program, let me know and I will forward more detailed info.

This program has also been featured in many recent issues of CQ, 73, and QST
magizines.

Press Release:
1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

Permission is granted to reprint any or all parts of this press release.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: hhtp://www.tapr.org/tapr E-Mail: tapr@tapr.org
---

It's that time again! Time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communications Conference.

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communication Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft. Worth International Airport, which is located in the middle of the country and airfares have never been cheaper for this conveniently-located conference.

Not only is the Digital Communication Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The Digital Communication Conference is for all levels of digital operators. A must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communications Conference ?

A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communications Service) technology on Sunday.

A Texas-sized banquet with a Special Guest Speaker.

SIGs (Special Interest Groups) on Saturday following the banquet.

Informal get-togethers throughout the weekend.

A meeting facility that is perfect for this type of meeting.

Vendor area and informal engineering discussions.

Scores of nearby restaurants and entertainment
(Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf)

An event at which the most important new developments in amateur digital communications are announced.

Digital 'movers and shakers' from all over the world in attendance.

Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines, computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems, his company Warpspeed Imagineering focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours? If you have never been, then make your plans now to attend and find out how much fun these late night discussions can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and

more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communications Conference on September 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD - President, Tucson Amateur Packet Radio
Dave Wolf, WO5H - President, Texas Packet Radio Society

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information
Conference presentations, meetings, and workshops, will be held at the La Quinta Inn and Conference Center, 825 N Watson Road, Arlington, Tx, (800) 531-5900, (817) 640-4142, Fax (817) 649-7864, intersection of I-30 and Texas 360. Rooms rates are $53/single, $58/double, $63/triple, and $85+ for suites. When making reservations with the hotel, be sure to indicate you are attending the conference. Six Flags (larger than Disney Land), the Texas Rangers, and several other attractions are within a few miles of the hotel. If you are planning to stay at the hotel, it is highly recommended that you book your room prior to August 25th, 1995 -- a block of 100 rooms is reserved for Friday and Saturday. The hotel provides transportation to and from D/FW International Airport. You should contact the hotel to arrange airport transportation.

Registration
Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to pre-register or for additional meeting information. MasterCard and VISA accepted.

Digital Communications Conference
==========
. Pre-Registration (before August 21st) $30.00 * ________

2827. TAPR Information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-29 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <200224.ensmtp@teachnet.edb.utexas.edu>
Source record: 42714

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that
TAPR provides allows anyone to request information on TAPR, products,
newsletters, and lots of other files. To find out more about this service,
send an e-mail message to listserv@tapr.org with the subject line "Request"
and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions
for info, "index -all" retrieves a list of available files by topic and
"taprinfo.txt" retrieves a text file containing information on TAPR and what
TAPR is all about. If you want to retrieve several text files with one
message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet
issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of
amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through
publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS
TAPR-TNC SIG on TNC Technology

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.tapr.org' in the directory
/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://www.tapr.org/tapr

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, for his support and invaluable contributions of
the TAPR page.

>one big mess on a single window.

Paket is NOT dual port aware, so no matter what you do, the HF and VHF stuff will be together. The only time it will switch streams is when you actually have connects on different streams. Be sure you have hardware flow control using a full 232 cable. If you are using software flow control Paket can miss the connect messages it looks for to tell when a connect occurs. With hardware flow control, the software looks for the state of the CD line to tell when a connect happens, and the CD state is a whole lot more reliable than watching for the ***Connnected to XXXX message.

>I'd like to use this program

Try XPKAM with your KAM. It is an actual host mode dual port program written for the KAM. You can ftp it from ftp.indirect.com and try it out. I've used Gary's programs a few times and they look pretty darn good. You can even send email to Gary, the author, when you have questions.

Hi name here is Chris,

I run a dumb terminal to a KPC-3 and Icom 2 meter, it sits about
3 feet away from my 486, everything works great with the packet rig
until I boot up the 486 then everything goes haywire, lots of inter-
ference to the radio, so much that I have to turn the squelch up and
that practically renders the packet rig useless.
Is there something that I can do to help this?

thanks much,
Chris

We are working on a slow-scan Macintosh program. However, I do not expect
to have it out until around the end of the year, or maybe by Dayton 1996.

My brother, KB2ICI, did the basics a few years ago, but we never got
around to getting all the extras put into it.. Now we are working on it
again, however, it will take awhile to get it finished..

>TNX, Arnold [OE6APF]

As you may know, any terminal emulator program, and most telephone modem programs, will work just fine with the TNC2. I've used ProComm on DOS machines for years. I don't know of any Amiga programs written specifically for plain packet, but someone ported KA9Q TCP/IP to the Amiga some time back. Look at ucsd.edu for the files.

2839. Re: Kenwood TM-733A on Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-06-30 00:00:00 UTC
From: "Ricahrd (Dick) Kriss" <dkriss@moontower.com>
Message-ID: <3t0m9h$daq@beacon.moontower.com>
Source record: 42592

The following is a blurb from AEA on the PK232 and TM-733.
It may help!

TM-733A PK-232MBX
Pin 1 PKD packet data input Pin 2 White, TX audio
Pin 2 DE Ground for PKD Pin 4 Brown, Ground
Pin 3 PKS Packet Stand BY Pin 5 Red, PTT
Pin 4 PR9 Detector 9600 bps No Connection
Pin 5 PR1 Detector 1200 bps Pin 1 Green, RX audio
Pin 6 SQC Squelch Control Pin 3, Black This is not
normally used so do not
connect up the Black wire

This should get you going let me know if you have any troubles, make
surethe DCD lamp is not lited after you connect up to Pin 5 of the
TM-733A.The PK-232 DCD should only lite when a packet is heard.

Message-ID: <1995Jun30.153620.892@tijc02.uucp>
Source record: 42727

Some years ago I recall Phil Karn, KA9Q, making available a TCP/IP implementation for intel platforms to the amateur radio community for experimental purposes. His distribution I believe included both assembler and C source code.

I would like to obtain a copy of that offering. However it appears that it has been enhanced over the years into a Network Operating System, the latest being "wnos4a8", and at least from what I found on SimTel, no longer appears to include source code.

I believe I need the "bare bones" version as it existed several years ago, and I do need the source code.

Is anyone aware of where it can be found? -- or a replacement?

Thanks

>73 de Bill B., KC7JSD

NOPE! this won't work. Telephone type 1200 baud modems use a
completely different (and more complicated) modulation scheme
because of the more limited bandwidth. The modems used for 1200b
vhf packet are actually of an earlier design, originally intended
for 1200b over LEASED phone lines with higher bandwidth. The ARRL
handbook explains the difference, as does the smartmodem 1200 manual
which talks about using the modem for amateur radio application, but

at 300 baud.

You -might- be able to find one of the right kind of 1200b modem somewhere, but there can't be many of them left.

Here's how:

1. Learn DC electronics.
2. Learn AC electronics.
3. Learn semiconductor electronics.
4. Learn soldering.

Now, which of these do you need help with?

Try a link with W0RLI on 14.113.50 or 21.093.50 (dial
reading, lower sideband). I'm in West Linn, you should
have no problem connecting.

Once you verify that your board is working ok ... look on
even Khz and even half Khz from 14.097 to 14.116, 7.100 to 7.107
you should find plenty of activity.

... Hank

Had to use the yl's computer for the bbs theirs broke. So that she would be able to use it some. I put win 95 final beta on it. suprise of suprises. It ran better and had more memory available than before system will now hold 10,000 messages and 10 connects all at once. I put it in start up and because I live in FL. the juice go off often it boots its self and runs great. I can defrag the system while bbs runs. Have yet to run into a situation where I can't do several other things while bbs runs in the back ground. Yes I know OS/2 will probably do the same thing but has anyone gotten any help from IBM lately. I bought a copy of Warp when It first came out and they wouldn't even talk to me about most things. This is a 386 sx 20 with 387 math co and 4 megs ram 87 meg Hard drive. I can even edit the files and never have to take the bbs down for house keeping. 73 AD4RR@KE4YVZ DAB FL NOAM

A little more info on my problem: JNOS _DOES_ do a trace to a file with the "trace tnc0 111 <filename>" command, but will not trace to the screen. I tried the F9, param tnc0 up, and other suggestions without success. All other screen writes work fine.

Thanks to all who have been giving me suggestions.

Hi -

It sounds like you have an excellent setup for what satellite operators call "mode A," 2 meters up and 10 meters down. The only satellite active on Mode A right now is RS-10/11. You'll find quite a bit of activity there. You should get a tracking program for your computer so you can know when the "bird" will be visible from your location. If you don't have an "az/el" (azimuth & elevation) rotor that can go up and down as well as around, then you should look for passes that are relatively low to your horizon.

You'll find a complete introduction to operating amateur satellites on the CQ video, "Getting Started in Amateur Satellites," which is available in PAL (European) as well as NTSC (North American) video format. If you'd like information about this video, any other CQ products or ordering from CQ online, please send me an e-mail message and I'll give you the info you'd like.

2858. Problems with BayCom/BayPac Help!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-01 00:00:00 UTC
From: rbrummer@nickel.laurentian.ca
Message-ID: <1995Jul1.211024@nickel.laurentian.ca>
Source record: 42595

I am having trouble getting a BayPac Packet Modem to work with Baycom V1.5
and a Radio Shack HTX202 Radio. I seem to be able to monitor activity
but my system does not correctly decode messages intended for me. I have
checked all of the obvious things but must be missing something. I notice
that when a packet addressed to me arrives, my rig begins a TX almost
immediately, and it seems to me that it is attempting to interrupt the
node. The node's TX continues after my TX stops. Something like this:

1. Radio receives (squelch opens).
2. About 0.5 seconds later my radio begins a TX (apparently in acknowledgement
but without waiting for the node to stop.
3. My TX stops
4. Rig continues to receive tail of node's communication.

Has anyone else had similar problems?
Is this the way it's supposed to be? Seems odd to me.

I would appreciate any help (or alternatively a real TNC at a good price!).

73's de VA3RKB.

And where have you been hiding all these years? ka9q is very much alive
and comes in many flavours: Original ka9q, Wampes, NET.pe1chl, JNOS and
W(crash)NOS. The crash because the writers of the latter implementation
insist on using a compiler with buggy heap management. But as it runs only
under AMessDOS, it is no great loss either.

All these various incarnations may be found on a multitude of ftp
servers, just have a look around.

KA9Q TCP/IP has grown into a number of parallel, similar, but different products. I use JNOS - the latest version is 110J - the source can be found on ftp.ucsd.edu - somewhere under ham radio (packet / nos / jnos or incoming)
Its about 1.2 Mbytes zipped. It "requires" Borland C v 3.1 to compile - older versions still work, newer versions are marginal. Good luck and 73's de Dave, kd6pro.

You are probably referring to Phil's NET program, which preceded NOS. The
last release of that was 890421.1 and may be still around somewhere. There is
an updated version with enhancements by Joe Buswell, K5JB available on
ftp.tapr.org in /tapr/software_lib/tcpip/netk34ex.zip and netk34src.zip

2865. Simplex Repeater

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-01 00:00:00 UTC
From: Jim Weir <rst-engr@oro.net>
Message-ID: <NEWTNews.9043.804630577.rst-engr@rst-engr.oro.net>
Source record: 42602

We are in the final stages of a design of a simplex repeater. A simplex repeater is one that listens to a simplex frequency on a plain old mobile or HT radio. When it hears audio, it stores that audio in a voice storage chip. When the audio stops, the repeater control keys the transceiver's transmitter and retransmits the audio that was stored. It makes for a very simple, very inexpensive repeater that can be as frequency agile as you please. If the transceiver has CTCSS, then you can also have the repeater tone squelched if you please.

We have a 20 second audio chip on the bare bones version. A second version consists of the original chip plus a DTMF decoder for turning the repeater function on and off from a remote location. A third version adds a second voice chip as a "mailbox" that is accessed for both record and playback with separate DTMF tones.

Are there any goodies (within reason) that we left out?

They begin as rec.radio.amateur.

and end as:

,antenna
.digital.misc
.equipment
.homebrew
.misc
.packet
.policy
.space
.swap

So there ya go.....

Hiding? They're not hiding, you're not looking!

Here are some of the amateur radio related groups I carry.

rec.radio.amateur.antenna Antennas
rec.radio.amateur.digital.misc Packet, RTTY, etc
rec.radio.amateur.equipment Repairs, mods, etc
rec.radio.amateur.homebrew Rolling your own
rec.radio.amateur.misc Whatever doesn't fit elsewhere
rec.radio.amateur.policy Rules, regs and repeater cops
rec.radio.info General radio information
rec.radio.shortwave For Shortwave listeners
rec.radio.swap Buy/Sell Radio gear, including Amateur

There are also more rec radio groups for broadcasting, non-commercial
broadcasting, scanners, etc. And mailing lists for all kinds of interests
- packet, dfing, arrl bulletins, boatanchors, you name it.

Read news.answers for a while. There are periodic posts there listing all
newsgroups and most lists.

That's odd, none of these are what he asked for assistance with.
He only asked that someone that knows how to do the mod let him know
how it is done.

Dear Friend,

THank you for reading this message. I have this set,
UNIDEN, model HR-2600, SSB/CW/AM/FM for 28MHz (10M), only.
By the way, I would like to modify/extend frequency to
use in CB band, (27 MHz).
So, please, if possible, help to get schematic for
modification. All reply will be very appreciated! I thank
you very much in advance! And, I hope hear from you soon.
Vy best wishes and 73,
Karl M Leite, PS7KM

A good crystal source is:
QUARTSLAB
P.O. BOX 19
ERITH
KENT DA81LH
GREAT BRITAIN

telephone 0322 330830 fax 0322 334904
They charge about 5.75 pounds for each crystal, VAT and shiping cost included.

Yours, Luis, eb1evb

Wow... Wouldn't that be cool for foxhunting? It's over there - No - it's over THERE....

Really, I think you've about got it. CTCSS and DTMF encoding/decoding are good, of course. I could think up a way to acknowledge the transmission, though, and a retry function. When the relay tries to retransmit, it would be nice if it could be set up so that if it doesn't get an ack, it would retry until it does or it's told not to bother.
What I'm thinking of is a SAR application where one HT hits another HT, that HT hits another, and the third HT gets "out" to the base camp. This has been done, but it's always been a mess in terms of freqency control (cross band stuff, etc etc) This system could be a LOT easier.

Any 6 meter packet out there ?

I 1-min. beacon (1200 baud) on 50.620 or 51.700 MHz. Would like to know in what areas, what 6m digi frequencies are being used.

And what about FEC & the TOR modes at the low end. Does 50.095 sound like a good FEC beaconing freq ?

Your thoughts...

2877. Net/Mac Latest Release - FTP Sites + Disk Option

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-02 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0207950246290001@wd1v.mv.com>
Source record: 42614

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

version NET_Mac2.3.53

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Added hostname to 'ping' output
- Some cosmetic mods for popmail
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
(from Adam PA2AGA (e-mail: adam@iag.tno.nl)

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

Free "Macnet Roster" HyperCard Stack

"Macnet Roster" (ver. 674) has just been updated and lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

2879. Free - Apple II Pkt Program

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-02 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0207950250100001@wd1v.mv.com>
Source record: 42616

ATTENTION PACKET OPERATORS WITH APPLE II COMPUTERS

The long awaited new version of the APR (Apple Packet Radio) program, V3.0, is now available! For those of you not familiar with APR, it is a terminal emulation program for Apple II series computers. In addition to normal terminal emulation functions, it has many special features for use with a TNC; short-cut commands for changing TNC operating modes, calling stations, etc. It also has a scrolled screen text buffer, supports binary file transfers and YAPP (tm) file transfer protocol. It also has a "file server" feature that (under operator control) allows other stations to connect and download files unattended.

The program can be used on the following Apple II series computers: IIgs, //e, //c and][+ (with 64K memory and upper/lower case video). On machines without a built-in modem port, a Super Serial card is required in Slot 2 for TNC communications.

For a copy of the program (and a few miscellaneous utility programs), send a blank disk -- either 5.25 in. or 3.5 in. -- (no HD disks, please!) along with a disk mailer with sufficient return postage to:

Larry East, W1HUE
1355 S. Rimline Dr.
Idaho Falls, ID 83401

For more information, just send an SASE.

73, Larry W1HUE @ WT7B.ID

I have a problem.While working pactor if I type I get all kinds
of strange noise in the computer and wrong letters on the tube.Macros
come out fine .This makes me believe my problem is in the keyboard.This
happend a while ago thought I fixed it with a torroid on the keyboard
cord,worked fine for a couple of months now the problem is back.Note:
this happens on 20 mtrs only everything is grounded(but should I ground the computer
case to the buss with all the radio equip? the ac line protector the
computer is plugged into is connected to the common ground buss)also
I have a no name keyboard could that be my problem??

Thanks for the help.......JIM........

This is the PTT line.. Kenwood has caused great confusion among
amateurs worldwide by using this strange description..

I had serious trouble using the TM733 for 9600. It seems to be a PLL
modulated trx. The modulation has a peak around 63 Hz.

Furthermore, there is a bug in the modulation circuit. When trying to
do more than 2.5 kHz deviation, the modulation becomes very distorded.
(on the 9600 data input)

This is reported on more TM733's throughout europe.

And the turnaround time of 140 ms is'nt what you would want for a 9600bd
read transceiver either...

There's a couple of us up here in Minneapolis, MN that run TCP/IP (1200 bps packet) on 50.76 FM. We get better propagation than what we get on 2m. The only problem is that the other station on here seems to get bursts of noise that wipe me out. He has a gateway to 2m. From there, I can then jump to another gateway and to other 2m freqs, to UHF, or to the Internet.

For a while we ran 50.76 LSB and that seemed to go more or less okay, but changing the RIT all the time drove us nuts.

About a year or two ago, we experimented with PacTOR on this same freq. Worked quite well. Did a little of the AmTOR and Baudot, but not much. Probably won't be going back to those other modes much now that we got tcp/ip going.

Press Release: June 1, 1995
1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

Permission is granted to reprint any or all parts of this press release.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: hhtp://www.tapr.org/tapr E-Mail: tapr@tapr.org
---

It's that time again! Time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communications Conference.

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft. Worth International Airport, which is located in the middle of the country, and airfares have never been cheaper for this conveniently-located conference.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communications Conference ?

* A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

* Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communications Service) technology on Sunday.

* A Texas-sized banquet with a Special Guest Speaker.

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Vendor area and informal engineering discussions.

* Scores of nearby restaurants and entertainment (Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf).

* An event at which the most important new developments in amateur digital communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

* Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

The 1995 Digital Communications Conference is co-hosted by Tucson Amateur Packet Radio (TAPR) and the Texas Packet Radio Society (TPRS). TAPR has been active as an international amateur research and development organization since 1981 and was responsible for development of the TNC-2 and other amateur kits and publications. TAPR currently has more than 2500 members, worldwide. TAPR continues to provide leadership in digital amateur radio activities by supporting Special Interest Groups, conferences/meetings, publications, and research and development projects. TPRS has been active as an organization since 1984 and has been responsible for the development of the TexNet network in Texas, Oklahoma, Arkansas, and Missouri. TPRS membership now tops 500 members.

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 21, 1995, and should be submitted

to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours! If you have never been, then make your plans now to attend and find out how much fun the Digital Communications Conference can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communications Conference on September 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD Q President, Tucson Amateur Packet Radio
Dave Wolf, WO5H Q President, Texas Packet Radio Society

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings, and workshops, will be held at the La Quinta Inn and Conference Center, 825 N Watson Road, Arlington, Tx, (800) 531-5900, (817) 640-4142, Fax (817) 649-7864, intersection of I-30 and Texas 360. Rooms rates are $53/single, $58/double, $63/triple, and $85+ for suites. When making reservations with the hotel, be sure to indicate you are attending the conference. Six Flags (larger than Disney Land), the Texas Rangers, and several other attractions are within a few miles of the hotel. If you are planning to stay at the hotel, it is highly recommended that you book your room prior to August 25th, 1995 -- a block of 100 rooms is reserved for Friday and Saturday. The hotel provides transportation to and from D/FW International Airport. You should contact the hotel to arrange airport transportation.

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to pre-register or for additional meeting information. MasterCard and VISA accepted.

Digital Communications Conference
==========
- Pre-Registration (before August 21st) $30.00 *

- Late Registration or at door $35.00 *

* - Conference Registration includes:
Conference Proceedings, Sessions, Meetings, and Lunch.

- Saturday Evening Dinner $17.00 **

** - Dinner, Speaker, Prize Drawing (Limited Space)

Workshops
==========
APRS Workshop, Friday, 4pm - 7pm. Conducted by Keith Sproul, WU2Z

- Pre-Registration (before August 21st) $10.00

- Late Registration or at door $15.00

PCS Workshop, Sunday, 9:00am - 1:00pm. Dewayne Hendricks, WA8DZP
Survey of Personal Communications Systems (PCS) Technologies and their
application and use in the Amateur Radio Service

- Pre-Registration (before August 21st) $10.00

- Late Registration or at door $15.00

2888. Help with tranciever for 2400 BPS modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-03 00:00:00 UTC
From: site@flood.xnet.com
Message-ID: <3t7let$92g@flood.xnet.com>
Source record: 42625

My previous post must not have made it through. (were having trouble with the server or some provider somewhere) My question relates to trancievers, I am new to radio and need some direction. I am currently building two 2600 BPS modems (using the EXAR chipset XR-2400 with XR-2443 microcontroller) These are standard telco modems, but I am adding audio in and out jacks. Can I connect these directly to audio in/out of the tranciever? If I used a 9600/14.4/28.8 modem could I connect it directly? What frequency should I look for? What price should I expect to pay? I am building 2 to set up a communications link between two devices through standard serial ports. I have heard *some*thing about a TNC, is this for packet radio? With my setup will I be able to access packet radio? Ack, I am confused. Will this require an FCC license, if so where can I get a book to study for it. I need a range of a few miles, but if price is too much I can settle for around 500ft. Are there any FCC regulations against encrypting my signal? Can I keep it up for extendad periods?

That's enough questions, I would really appreciate it if you could Email me at site@xnet.com, thanks!

2889. APRS 7.0 AVAILABILITY?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-03 00:00:00 UTC
From: RFWM40A@prodigy.com
Message-ID: <3t7nnf$2mh2@usenetp1.news.prodigy.com>
Source record: 42626

Does anyone happen to have a good ftp address for the current version of APRS. I believe that it is currently 7.0.

My archie search has listed a couple of addresses but they don't appear to have 7.0 on line.

Thanks in advance

Dave

it'll be Even Better (tm) when Microsoft actually delivers an "official" copy
of windows 95 (now supposed to be October. they'd better start being careful
or they'll accidently find themselves in 1996).

does this mean the "We Won't Forward Brevard County Traffic Unless You Do
It All Our Way" battle starts up again?

someone's got a win 95 packet bbs? somehow i don't think the number of
simultaneous connects and number of messages really has a lot to do with
operating system selection (other than to pick one that can do more than
one thing at a time.)

In <NEWTNews.6742.804569788.drayegon@drayegon.america.com>, drayegon@america.com writes:
>Had to use the yl's computer for the bbs theirs broke. So that she would be able
>to use it some. I put win 95 final beta on it. suprise of suprises. It ran
>better and had more memory available than before system will now hold 10,000
>messages and 10 connects all at once. I put it in start up and because I live in
>FL. the juice go off often it boots its self and runs great. I can defrag the

get a UPS. i need one here too. soon tho..

>system while bbs runs. Have yet to run into a situation where I can't do several

could use a file system that needs minimal maintenance as well...but...is
fragmentation a real problem or is it just something you do a lot as a mantra?
it's not like packet radio is terribly fast in the first place so even a badly
fragmented system would still be faster. it's more important that you can backup
your system in parallel with other tasks..

>other things while bbs runs in the back ground. Yes I know OS/2 will probably do
>
>the same thing but has anyone gotten any help from IBM lately. I bought a copy

I would guess you'd get the same level of help from Microsoft as you would
from IBM if your non-same-name application didn't work. (Hello, Microsoft? My
copy of 1-2-3 doesn't run....on hold for 5-10 minutes at $x/hour before they
tell you to buy Excel..)

Press Release: June 1, 1995
1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

Permission is granted to reprint any or all parts of this press release.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: hhtp://www.tapr.org/tapr E-Mail: tapr@tapr.org
---

It's that time again! Time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communications Conference.

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft. Worth International Airport, which is located in the middle of the country, and airfares have never been cheaper for this conveniently-located conference.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communications Conference ?

* A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

* Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communications Service) technology on Sunday.

* A Texas-sized banquet with a Special Guest Speaker.

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Vendor area and informal engineering discussions.

* Scores of nearby restaurants and entertainment (Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf).

* An event at which the most important new developments in amateur digital communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

* Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

The 1995 Digital Communications Conference is co-hosted by Tucson Amateur Packet Radio (TAPR) and the Texas Packet Radio Society (TPRS). TAPR has been active as an international amateur research and development organization since 1981 and was responsible for development of the TNC-2 and other amateur kits and publications. TAPR currently has more than 2500 members, worldwide. TAPR continues to provide leadership in digital amateur radio activities by supporting Special Interest Groups, conferences/meetings, publications, and research and development projects. TPRS has been active as an organization since 1984 and has been responsible for the development of the TexNet network in Texas, Oklahoma, Arkansas, and Missouri. TPRS membership now tops 500 members.

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the

Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours! If you have never been, then make your plans now to attend and find out how much fun the Digital Communications Conference can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communications Conference on September 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD Q President, Tucson Amateur Packet Radio
Dave Wolf, WO5H Q President, Texas Packet Radio Society

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings, and workshops, will be held at the La Quinta Inn and Conference Center, 825 N Watson Road, Arlington, Tx, (800) 531-5900, (817) 640-4142, Fax (817) 649-7864, intersection of I-30 and Texas 360. Can anyone point me to information/specifications on Weather Fax.
I'd like to add Weather Fax decode to a Mac marine navigation
program I'm writing.

Thanks in advance,

jw

2893. 9600 BPS radios

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-03 00:00:00 UTC
From: pcarter@freenet.columbus.oh.us
Message-ID: <3t8rkt$8ue@acme.freenet.columbus.oh.us>
Source record: 42630

Has anyone had any experience using any of the new 9600 bps ready radios at 9600 bps packet on 144 Mhz.? I HAD an Alinco DR1200 that took a lightning punch on the PTT line (blew the control processor) which locked the tx on for a few hours. Radio still rx's fine, but I would have to change the control processor to find out if it is worth repairing further. I tried the reset, so I know that isn't it...in fact you can reset this radio in many modes...

This radio is about 2 yrs old and has served me well at 9600 bps (it's never turned off). However...

I have read the reviews in the May (I think) QST on the "9600: ready or not", but I have not convenced myself of the validity of the tests. I understand the TM733 has a few problems from some of the posts I have read. I have not had time to check the schematics of the radios to see if they are PLL modulated or VCO modulated.

Any info helpful is appreciated. Radios considered are the Icom 821H, Kenwood TM251, Yeasu FT2500, Alinco 1200T, and a Midland Commercial model.

Mods of course are not a problem.

Thanks to all...

I'm going to write a software for SCC card such as OptoPcScc, so I'd try to
use TFPCX as driver.
I was not able to find the necessary documentation about this driver, in
TFPCX.DOC (of version 1.10 since that's what can be found in ver 2.10 too!)
there is only a brief descripition of the main interrupt function: receive and
transmit byte; but I need to know how other function such as chip and channel
selection and other.
I've found that value of AH=0xfb,0xfc,0xfd,0xff also return a non FF value in
AH so it should be active function, but what they are???
Thanks in advance for any info or suggestion.

Source record: 42633

Hello all and thanks for reading this message.
Maybe this is not the right place to post this message but i dont have
any other choice because its the only conference i have.
I have a KENWOOD TS-450 AT it was running for the last 4 years with out
any problem.
last night i noticed somthing when i tried to tune on 20M it refuse to
tune when tried it on 15M it tuned very fine as ussual but when i start
talking to the mike SWR raising and jumping up when i turned back to 20M
again it tune again but when i start talking SWR jump again...!!!
I inspected the coax its ok also the connection at antinna end was fine
I revised my self if i did any mistake or abused the radio..
I found my self using and tuning my lenear amplifier when the antinna
tuner button was pressed on and i wounder if this w,ll cause any damage
to the tuner or not...???
there was a heavey wind turned the antinna and tuched trees .
now do u think the tuner is damaged ???
but it tune properly and easly on other bands exepet 20M unless if i
talk SWR jump up..!!!
PSE any help any word w,ll be usefull..
thanks in advance.. and best 73,s de Ibrahim.
PSE send E-mail or just leave a message here.

*** SOLUTION ***

Thanks to all who gave me tips on how to get JNOS to trace to the screen. The "str off" did the trick. That command is not in the docs that I have and is not even listed as one of the commands. It seems to be working great now.

If the TNC is in KISS mode, getty won't do the trick. In KISS mode you
should have AX.25 compiled into the Linux kernel, set up the TNC with
axattach, and setup a program to listen for ax.25 connects. Bruce
Perens AB6YM bruce@pixar.com has some good utilies to give you a
login: prompt.

You might be able to do it if you put the TNC in host mode and run getty
with the proper /etc/gettydefs file. Look at the stty(1) manual page
to see which settings are needed for translating CR's and NL's

[Stuff Deleted]

How many cycles is the audio storage chip good for?

The manufacturer claims a minimum of 100K, with
somewhere between 100K and 1M cycles being the
practical answer. However, the chip is socketed
and is $15, so if you did 100 messages a day
(and that's pretty high usage) the chip would be
good for somewhere between 3 years and 30 years,
or somewhere between $5 and 50 cents a year.

We are targeting price of basic unit at $99, with
an add-on DTMF controller and single mailbox at
$199 or so. Don't hold me to the numbers. You
are talking to engineering, not mfg or mktg.

Our goal is to have it powered and run totally
from the microphone connector -- we are pulling
our 5 volt supply (40 mA max), speaker audio, and
microphone audio/key all from that connector (or
the speaker plug on the back panel for those that
don't bring speaker audio to the front).

'nuff?

Jim

Is anyone running both SLIP/PPP (Internet dial-up) as well as amateur packet radio (TCP/IP) with the Internet Access Kit that comes with OS/2 Warp? I'd like to get into packet without disturbing my current PPP setup for the Internet, using separate COM ports, naturally. (On *ONE* computer... <g>)

If you've succeeded, can you tell me how you've set it up? Did you use JNOS?

I am looking for software that will allow a 8-bit Soundblaster card to function as a crude oscilloscope. I was told by a fellow ham that a UK magazine (Wireless or Shortwave?) had a short review of it about 2 yrs ago. I can FTP or search via Archie or Veronica if someone can provide me with a filename.

I'd like to get a hold of it before my foray in 9600 baud packet, so I can monitor my deviation.

Please EMail if possible.

Hi Dave,
I us jnos on my machine, can't get the IAK to speak ax25 to connect with my IP gateway machine.
Jnos works fine under OS/2 & I use an ethernet connection to the other box. I'm going to get Warp Connect & see if it will work but haven't heard of an ax25 module for it yet, might be one somewhere. Good luck 73 N0TZL

2912. PacketRadio on 18th World Scouting Jamboree

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-04 00:00:00 UTC
From: bas.mastebroek@giga.iaf.nl
Message-ID: <bas.mastebroek.7.00159EAB@giga.iaf.nl>
Source record: 42649

Hello everybody,

On 1-11th august the "18th World Scouting Jamboree" is held at the
Netherlands (Dronten). The Amateur-Radio group organizes several
activities for the scouts. This contains "walk-in" as well as
"ticket" activities. In this announcement we focus on Packet-Radio.

Our PacketRadio equipment is situated in the Radio-Shack tent on-site.
The node PA6WSJ-9 is connected to the amateur network via PI8WFL.

An overview of our activities:

1. processing personal addressed mail for scouting groups
2. connected to amateur "Chat-Box"
3. receiving PA6WSJ mail and SCOUTS bulletins
4. other

NOTE: For people reading this message from a Internet newshost,
the previous activities are accessible for radioamateurs
only, or scouts accompanied by radioamateurs (similar
restrictions during JOTA activities).

1. It is possible to send personal mail to your scout-troop. For
a quick effective flow of this mail (message filtering), it
must be written a bit different than "normal" mail to PA6WSJ.

Please write "-PERSONAL MAIL-" on the subject line. The "address"
of the troop, the subject and the message itself go in the message
body.

Example from FBB mailbox:

SP PA6WSJ@PI8WFL.NLD.EU (send MSG to our address)
-PERSONAL MAIL- (indicator for our filter)
Name : Happy-scout (address)
Group : Happy-scout-group (address)
Country : Some-country (address)
Subkamp : Serpens (No. 10) (address)
Troup.No: 17 (address)
Subject : Success from scouts at home (subject of the message)

(Begin message)
Hello all, have a nice time! ()
()
All the home-staying scouts. (End message)

2. We are connected to the international amateur conference bridge,
simply said: "Chat-Box". You can recognize our terminals by our

callsign PA6WSJ.

Scouts from many countries can type with these terminals to amateurs.
This announcement is in English, but communicating in other languages
is very welcome! (don't forget this jamboree houses scouts from
approx. 120 different countries all over the world).

A list of conference bridge commands can be obtained by connecting a
"Chat-Box" node and typing "/HELP" for help. For more info, or the
location of your nearest "Chat-Box", ask your local Packet-Radio guru.

Some nodes containing a "Chat-Box" (Conference Bridge):
4Z4ZQ-1 IW5DAM-7 K2CC-2 N2NON-1 N8FOW-10 N8GNJ-8
N8KHN-2 OH3RBR-3 OH7RBA-3 PI8VNW-9 PP5UF-8 RA3APW-7
VE7SFU VK1BUD-5 VK3ERM-7 W8UPD WA2HEE WA7SLG-2
WB3BOI VE2UMS-5 (VE2VAX)
(some maybe's: PY2BJO-5 VK2PK-5 W5GB-9 WB9UUS-2)

NOTE: Not all the nodes mentioned above were tested, but taken
from the resourcelist, version 1.12 1995/04/05 07:57:34.
Check if the "Chat-Box" you connected is global (not local!).

3. Our FBB-BBS, which is connected to the am.network via our node,
doesn't only accept the personal addressed mail for some groups (1).
Both personal mail for PA6WSJ and the SCOUTS bulletins are accepted
and can be read by the operators/scouts in our tent.

4. Beside these activities other are possible, depending on the time
the operators have left.

Scouts can also send (censored) mail via OM/(X)YL's to their troops
at home. Don't forget to give your electronic address to your group,
if you like to get mail during the Jamboree....

Scouts on-site active on the "Chat-Box" can be used to entertain
a troop scouts at home (with the presence of a radioamateur
of course), giving them a bit of that "Jamboree Feeling".
Please contact us if you got some plans....

When you can reach our node with direct- or network-connect, chatting
with a operator/scout is possible (PA6WSJ-12), but mail or chatbox
is preferred.

Tech-info:

Our node PA6WSJ-9, running chl-NET, is connected to (and accessible for
other radioamateurs) the amateur PacketRadio network via PI8WFL. Local
node uplink PA6WSJ-9 at 430.825. BBS PA6WSJ-11 connected to the node.
Direct chat/connect is possible (see 4) trough PA6WSJ-9 to PA6WSJ-12.
Address for mail and personal addressed mail(1): PA6WSJ@PI8WFL.NLD.EU

For questions mail to:
Internet: bas.mastebroek@giga.iaf.nl
PacketRadio: pe1oov@pi8daz.#twe.nld.eu

Best regards,
The operators.

PacketRadio team of the 18th World Scouting Jamboree 1995
at Dronten-Netherlands.

I've had this problem before when I turned on my old SB200 for some extra
kick. :) I fixed it by moving my computer 2 feet farther away. Really -
that's all it took. Try moving the position of your equipment and cables
before going to a bunch of work. I've also been told that you can tape some
heavy aluminum foil to the bottom of your keyboard and that can help if you
have cables running along the floor. I haven't tried it, so I don't know if
it really does anything or not.

2914. JNOS compiled for 386 crashes under OS/2 - 8086 OK

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-04 00:00:00 UTC
From: daheath@ibm.net
Message-ID: <3tci2n$3ha0@news-s01.ny.us.ibm.net>
Source record: 42651

I've discovered something strange while configuring JNOS 110i (or g) to
run under OS/2 warp. JNOS must be compiled for an 8086 CPU or it will
be very unstable, particurarly when using an ethernet packet driver.
110i last only abt 5 minutes before it crashes. 110g runs fine until
about 100k to 3 megs of ethernet data pass through it, then it goes
belly up.

After compiling for 8086 cpu, 110i has been running
for 7 days trouble free acting as a gateway between my OS/2 based
ethernet lan and the ax25 ham packet network. I'm using the Ottawa
PI2 card connected to a WA4DSY 56kb modem for the RF side.
(JNOS2OS2.ZIP package required)

This setup allows me to use all the OS/2 Warp Internet tools, including
Web explorer over the air. There's also a sharewareOS/2 Web server available
which works fine.

I hope this info saves someone needless grief and wasted time.
If anyone knows why 386 compiles won't run under OS/2
please let me know.

Dale Heatherington, WA4DSY

>If you've succeeded, can you tell me how you've set it up? Did you
>use JNOS?

First you'll need IBM TCPIP 2.0 or Warp Connect. The IAK in Warp will not
talk to Ethernet cards. After you have configured Warps tcpip
stack for your Ethernet card you'll need another Ethernet card
for NOS to talk to. Get a packet driver for the 2nd ethernet card
and configure NOS to talk to that card. Then just hook the
Ethernet cards to each other with coax (and terminators).

NOS can then act as a gateway between your OS/2 tcpip stack
and ax25 stuff on the other side of NOS. I've been doing this for
about 6 months and it works fine. One word of warning...
I've just discovered JNOS has to be compiled for 8086 cpu
else it will crash when running in a DOS box under OS/2.

Now.... if someone would write an NDIS to ax25 driver we
could get rid of NOS and the 2nd Ethernet card. :-)

2916. The Amateur Radio INTERNET BBS - NEW Numbers!!

TELNET - bbs.abs.net

WWW - http://www.abs.net

FTP - ftp.abs.net

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 2.00b)
Misc. Info: Machine is an Pentium-100/MP running UNIX System V Release 4.2MP and features more than 9 Gigabytes of on-line file storage.
Most transfer protocols are available!! (multi-line system)

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC

MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
F6FBB BBS for the PC
G8BPQ PC-Node (Version 4.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /var/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic (ASCII Text)
-or-
uucp wb3ffv!~/FILES.Z /usr/spool/uucppublic (16-Bit Compressed)
-or-
uucp wb3ffv!~/FILES.gz /usr/spool/uucppublic (GNU Gzipped)

This will move a copy of my files listing into your uucppublic directory.

If you want to access the BBS via Telnet all you have to do is TELNET to bbs.abs.net, and login is 'bbs' with no password required. To use anonymous FTP just ftp to ftp.abs.net and login as 'anonymous'.

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Any ideas Id appreciate...have been noticing that after a long warm up period the tuning gets very jumpy...ie, not a smooth one for one match of frequency change per dial rotation. Its not bad right after power up, but after a few hours its murder. A simple solution? In its defense Ive gotta say its the only problem Ive ever had with it in 10 years.

Tnx in advance...rich

Dave,

Im very curious about this as well. QST printed a two part article of ham radio stuff on the net. In the second part, they had some discussion about setting up a local lan, via a tcp/ip program, and running netscape or another "browser" and giving the ability to browse other ham's computers via packet radio. Now here is my question.

If I figure correctly, my setup is this. Im running several "winsock" clients on my machine (FTP, telnet, eudora, netscape etc.) and they communicate to a Winsock Dialer, in my case Trumpet. Now, from there, trumpet is communicating, using PPP data, to the PPP server, who is then transfering my data back into tcp/ip data suitable for the net. Now, if someone could write a program that would allow winsock clients to talk KISS, then couldnt we load this winsock thing (I'll call it that, a thing, cause Im no computer genious) and load netscape, and turn on our tnc, which communicates via a gateway, and have the ability to browse the Web via packet? Does this sound far fetched? I mean, once the info leaves the remote PPP server, does it travel out as tcp/ip data? If so, then couldnt we bypass the PPP server, by sending the tcp/ip data from our winsock clients via Kiss mode, thru our tnc and straight into the net?

I realize that it would be slow as heck, but with today's broadening modem speeds, (we use 9600, or 19k2), it could actually be faster then some of my dialup options.

Dave, if this sounds like something you're asking, then what do you think?

Also, if there is anyone else who has any ideas, OR corrections, I'd seriously like to hear about them!

Hi,

Does anyone know if Japan shares the same freq. allocations in the 900 MHz band as the U.S. as far as spread specturm digital comm. is concerend? our group will be atteneding a race in Suzuka this August and we'd like to know whether or not the telemetry system in our vehicle (Fluke HYDRA w/wireless modems) will be a source of intereference.

Also, does anyone know where the Japanese 2m business band (kind of like our GMRS) lies? I'd like to know if our voice radios (RS htx-202's) will work there, too.

Thanks,

Dale,
I've always run a 386 compile of JNOS in my OS/2 DOS Box. I know of
several local hams that run 386 Compiles of JNOS in an OS/2 DOS Box. There
was an old problem with the stat() function. This would blow up JNOS in
both a OS/2 DOS Box and a Desqview window. This problem has been fixed.
I also recall a problem with some of the .asm files compiled with the
-3 option. These problems were fixed to. It has something to do with
pushing and poping registers from the stack.
I neve used a PI2 card. It might be a problem with the .asm files for
the PI2 card. Anyway... 386 compiles do work for me. Your milage may vary.

We are looking for an base-band HF simulator based on the
Watterson HF channel model for use in the evaluation of HF modems.

The simulator should preferably be PC based and cabable of simulating
at least the CCCR recommended 520 channels.

I would appreciate it if anybody that knows of componies that sell
HF simulators please to E-mail me info.

Thanks

Are you using an external antenna with your system?
The hash generated by the computer & peripherals can mask
an incoming signal and changes with different CPU activity.
Thus, I can suspect your system would hear a packet
addressed to you and then start to process it which could
create enough hash to mask the rest of the packet frame.
You can occasionally get away with operating with the
rubber duck to a nearby strong station but even then the
system is liable to fits and lockups from the RF, even on
low power, getting into the system.
The cure of course is an outside antenna.
You might also check your TXD setting, I usually set mine
to 45 or 55 (:txd 55)
It's also possible the transmitting station has HIS
parameters set up goofy, this may be the case if you can
communicate with others but have problems with one
particular station.

I don't know, but I would guess that gzip would be the only thing to go to now
that the LZW algorithm is in the royalty mode. Everything else is commercial.
Just a guess...

2930. Firmware to use to monitor X1J/NetRom?

Newsgroup: rec.radio.amateur.digital.misc

I am using a PacComm Tiny2 as a TNC to monitor our PacketCluster "backbone". The packets between "NetRom" and X1J nodes have a Packet ID of CFh. I have used MFJ, AEA, PacComm, WA8DED and G8BPQ software to decode these packets, and I am not pleased with the "user unfriendly" displays, although I have been able to troubleshoot adequately in spite of the shortcomings.

Your comments about a better way (or perhaps suggestions of different firmware to install in my monitor TNC) will be appreciated.

Dale,

It's likely (only a guess) that the 386 compiler makes some assumptions
regarding memory availability or configuration that are not true with OS/2.
It's the old "sloppy programming syndrome" ... one could get away with
almost anything in DOS since it was a single tasking operating system.
However, with its memory protection OS/2 is a bit more particular who and
what accesses which block of memory.

Thomas Grant Edwards (tedwards@Glue.umd.edu) recently wrote
in <3tfhdv$3vg@zydeco.src.umd.edu>:

: [There is a "cyberlobbying" attempt to support Apple's new "NII Band"
: proposal. Check out URL

: http://www.warpspeed.com/appleniipetitionrelate_277.html

: for more detail]

For those of you who have trouble typing looooong word URLs try

http://www.warpspeed.com/ Thank you Dewayne !

Apples proposal involves taking away One Hundred Fifty MHz of spectrum
from the Amateur Radio Service at 5.7 GHz and using it for a propriatary
high power vary wide band data network.

They are not satisfied with the current Part15 sharing of the same spectrum.

Comments are due to the Commission by the tenth of July.

2937. Apple Petition for Rulemaking: "NII Band"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-05 00:00:00 UTC
From: tedwards@Glue.umd.edu
Message-ID: <3tfh6i$3uv@zydeco.src.umd.edu>
Source record: 42674

I suggest everyone check out WWW
URL http://www.warpspeed.com/appleniipetitionrelate_277.html

Here are some excerpts:

This Petition for Rulemaking calls for the creation of a new band of frequencies for high capacity, unlicensed wireless data -- the "NII Band." Specifically, Apple proposes that the Commission allocate 300 MHz of spectrum in the 5 GHz range, comprised of the 5150-5300 MHz band (which has been allocated throughout most of Europe for "HIPERLAN" unlicensed wireless local area networks) and the 5725-5875 MHz band (which currently is used by unlicensed Part 15 technologies; industrial, scientific and medical ("ISM") devices; and Amateur operators).

The essential characteristics of the NII Band are:

* Adequate bandwidth to support high-speed applications (up to 24 Mbps or more) and large numbers of users;

* "Part 16" operation in protected spectrum and in conformance with an overarching set of technical rules, developed by the information industry;

* Equal access to the spectrum for all compliant devices and all types of communications; and

* Longer distance communications (10-15 km or more), creating new possibilities for unlicensed community networks.

The NII Band will be fundamentally different from any other wired, licensed-wireless, or unlicensed service. Unlike licensed-wireless services, no single entity will have an exclusive license to provide service using the spectrum. Unlike both licensed-wireless and wired services, availability will not be determined by a service provider's deployment plan or the economics of a fee-for-service offering.

Unlike traditional Part 15 operation, NII Band devices will not have to contend with unpredictable and uncontrollable interference, a host of different devices employing a variety of modulation schemes and power levels, and the continuing threat of giving way to incompatible services.

Unlike Data-PCS offerings, the NII Band will support very high-bandwidth transmissions and communications over longer distances. Unlike the proposed unlicensed bands above 40 GHz, the NII Band will support certain in-building and longer-distance communications that are not feasible using very high frequencies and will be amenable to more rapid product deployment.

The NII Band would promote the full deployment of a National Information Infrastructure ("NII"), extending the effective reach of the NII by making

possible high-bandwidth access and interaction throughout a limited geographic area -- where mobility is key -- both on a peer-to-peer, ad hoc basis and through wireless local area networks. Moreover, it would provide for unlicensed, wireless, wide area "community networks" connecting communities, schools, and other groups underserved by existing and proposed telecommunications offerings.

The NII Band would advance a host of public policy objectives, including assuring that all segments of society have access to the "information superhighway;" extending advanced telecommunications offerings to schools, libraries, hospitals, and government agencies; and promoting the participation of small businesses, businesses owned by women or minorities, and pioneering firms in tomorrow's telecommunications marketplace.

Because the NII Band would build upon, but transcend, both the European HIPERLAN effort and existing Part 15 unlicensed use, it would increase U.S. competitiveness and create new export opportunities; provide interconnectivity between U.S. and European markets, thereby furthering the creation of a Global Information Infrastructure ("GII"); and dramatically expand the applications that can be supported by, and the market for products operating in, the 5 GHz ISM band.

These goals can be achieved while accommodating most current and proposed uses of the 5150-5300 and 5725-5875 MHz bands, including Microwave Landing Systems ("MLS") (if, contrary to current expectations, MLS is used in the United States), "Big LEO" system feeder uplinks, Amateur operators, existing Part 15 devices, and ISM products.

Accordingly, Apple requests that the Commission expedite creation of the NII Band and adopt technical rules to hasten the development and deployment of new technologies.

Thanks. Actually... in LINUX/TNOS <-> LINUX/TNOS FBB Compressed
forwarding.... we're probably going to use GZIP as the compression method.
But that has nothing to do with LINUX/TNOS <-> DOS/FBB compressed
forwarding. I need to know what FBB 5.15c is using in order that TNOS
and FBB can talk using the lastest compression code. Currently, it only
supports the older compression code.

>Alan, n3sov

I wrote the QRZ CD-ROM Lookup code (QRZ.C) code for JNOS and TNOS. The
code compiles fine on LINUX/TNOS. It doesn't use the UNIX/LINUX code
on the CD-ROM. It's all based off of the DOS code. I think that there
is a '#ifdef STANDALONE' define in the QRZ.C code that will let you
run it by itself. I don't recall if that option works or not. I have
tested the code in standalone mode though.

The code does callsign lookups only and it outputs data to a file (or
maybe the console too). It's not fancy but it usually works.

Look for SoftKiss somewhere near ftp://ftp.ucsd.edu/hamradio/packet/mac/
and also pick up the complete set of NetMac stuff. Should check
/hamradio/packet/tcpip/incoming for the latest.

For those without WWW capability you can also get a copy of the petition as follows:

ftp: ftp.warpspeed.com
gopher: gopher.warpspeed.com

>Apples proposal involves taking away One Hundred Fifty MHz of spectrum
>from the Amateur Radio Service at 5.7 GHz and using it for a propriatary
>high power vary wide band data network.
>
>They are not satisfied with the current Part15 sharing of the same spectrum.
>
>Comments are due to the Commission by the tenth of July.
>
My read of the petition doesn't give me the impression that Apple is trying to take away 150 MHz from the amateur service. Their plan is to share that spectrum with hams and Part 15 devices. I also don't think that they plan to allow devices that operate under this new service to use high power. I believe that the power levels would be similar to those used today by Part 15 devices.

|>
|> 73 de Shawn, N7XBM.

Solution 1.

Purchase 50 feet of 100% shield rg-58 coax.
Plug one end of the coax into the radio.
Plug the other end into an outdoor omni antenna.

Solution 2.

Purchase 100 feet of 9913 coax.
Plug one end of the coax into the radio.
Plug the other end into an outdoor yagi.

Solution 2 works pretty well for me, with 8 radios and
5 computers in the same room, and no interference
between any of them.

Does anyone have any plans or know-how to convert an old telephone modem into a packet unit? I have several old telephone modems (1200-2400bps) that might work.

It seems to me that a surplus electronics company offered such a deal a while back, but wanted a few bucks for something really cheap.

What software would I run? Baycom?

Please let me know if you have any such plans or where I might be able to find them via the Internet.

Thank You very much. Dave Hartzell

PS Are there any Ham WWW sites?

I am looking for a listing of the packet frequencies in the Southern California area. I know thata few years ago, someone was preparing a listing of all the coordinated packet frequencies, and what nodes and bbs where on each frequency and the particular geographic area it covered. Is there anything like that now? I have found packet activity on 144.91, 145.01, 03, 05, 06, 09, but I don't know what areas they cover, and who is where, etc.

Any information on this would be greatly appreciated.

Thanks.

Can anyone out there tell me on what frequencies do the TCP/IP users in the Los Angeles / Orange County / SO. Cal areas hang out on 2 meters?

Also, are there any "Elmers" that can tell a newbie get up and running on TCP/IP on packet?

Is there anything close to a plug and play NOS for TCP/IP packet? If so, what is it and where can it be downloaded from?

Thanks.

Herb - KG6OK - Tustin, CA.

Telephone modems that are 1200/2400 baud, are BELL 212. The packet ones are
BELL 202. What that means is the tones are different. The only phone modems
that could be used are the 300 baud ones. I would buy a TNC if I were you.
It'll save you the hassle.

Chris

The QRZ lookup code is include in the latest TNOS 2.00 distribution and
'shoud' be part of the LINUX/TNOS compile that Brian does. If it's not
in the TNOS program Brian supplies, you'll have to compile your own.
The config.h file in the source code has it turned on, so I think it
should be in the base program.

Anyway... once you've got it in the TNOS file... if you do a
'finger callsign' it will look on the QRZ CD-ROM for the info. The default
location for the data is \nos\callbk. You can either have a symbolic link
to that directory or you can use the QRZDRV and QRZPATH enviornment
variables to tell TNOS where to look for the data. Your on your own about
setting the variables before you start TNOS. I think that the symbolic
link will be easier to set up. On my system.... I copied the data from
the CD-ROM to that directory because I didn't want to dedicate the
CD-ROM to the QRZ Callbook disk. Since all it does is callsign lookups,
all you need is the *c.* files from the \callbk directory.

There are other ways to access the data than finger. The callbook server
and client will also work. I don't recall the commands that are used to
start that. I have tested it though.

Just to clarify the situation, VHF Packet uses the AFSK format of the 202 modem family. The 212/224 modems are TOTALLY incompatible with this worldwide packet standard and require a FULL duplex media connection which amateur packet systems traditionally do not offer.

Hi, Paul....
Saw your messages in the area ragerding this item of interest... I am an Amiga user in am MS-DOS world. :-(I am looking for Amiga=based programs that I can use with my KPC-3 for packet, and also to enable the CAT capability of my Yaesu FT-736R (if any available).
I have both AmiCom and AmiPac for packet, but have not been able to get either of them to operate acceptably for me. I have an A2000 with 6 megs of RAM, accelerated with an A2630, multiple hard and floppy drives. I am running my packet station right now off the MS-DOS side of the Amiga with an A2088 bridgeboard. What a waste, eh?
If you know of any state-side BBS's that are Amiga/Ham oriented, I'd appreciate knowing a number to call. If not, I guess a call overseas is not completely out of the question.
Thanks much!

FAQ # 23...

No, it was replaced by this one. If your news server still shows the old group name, its directory has not been updated in over a year. You are been missing a huge number of new subgroups!

Hi all. Does anyone have an FBBIOS dated later than 8-11-93?
Approx size on mine is about 8300 bytes or so. It is a long story but
there is a bug with the modem routines in this one. Sometimes it will
detect a busy/ring no answer/no dialtone, and sometimes not. It locks
up my forwarding.

The problem could be with the FBB 5.15c code itself but just thought
I would check with you all.

2974. PacketRadio on 18th World Scouting Jamboree (Dronten-Netherlands)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-07 00:00:00 UTC
From: ringo@xs4all.nl
Message-ID: <3tjnt8$m1m@news.xs4all.nl>
Source record: 42561

Hello everybody,

On 1-11th august the "18th World Scouting Jamboree" is held at the
Netherlands (Dronten). The Amateur-Radio group organizes several
activities for the scouts. This contains "walk-in" as well as
"ticket" activities. In this announcement we focus on Packet-Radio.

Our PacketRadio equipment is situated in the Radio-Shack tent on-site.
The node PA6WSJ-9 is connected to the amateur network via PI8WFL.

An overview of our activities:

1. processing personal addressed mail for scouting groups
2. connected to amateur "Chat-Box"
3. receiving PA6WSJ mail and SCOUTS bulletins
4. other

NOTE: For people reading this message from a Internet newshost,
the previous activities are accessible for radioamateurs
only, or scouts accompanied by radioamateurs (similar
restrictions during JOTA activities).

1. It is possible to send personal mail to your scout-troop. For
a quick effective flow of this mail (message filtering), it
must be written a bit different than "normal" mail to PA6WSJ.

Please write "-PERSONAL MAIL-" on the subject line. The "address"
of the troop, the subject and the message itself go in the message
body.

Example from FBB mailbox:

SP PA6WSJ@PI8WFL.NLD.EU (send MSG to our address)
-PERSONAL MAIL- (indicator for our filter)
Name : Happy-scout (address)
Group : Happy-scout-group (address)
Country : Some-country (address)
Subkamp : Serpens (No. 10) (address)
Troup.No: 17 (address)
Subject : Success from scouts at home (subject of the message)

(Begin message)
Hello all, have a nice time! ()
()
All the home-staying scouts. (End message)

2. We are connected to the international amateur conference bridge,
simply said: "Chat-Box". You can recognize our terminals by our

callsign PA6WSJ.

Scouts from many countries can type with these terminals to amateurs.
This announcement is in English, but communicating in other languages
is very welcome! (don't forget this jamboree houses scouts from
approx. 120 different countries all over the world).

A list of conference bridge commands can be obtained by connecting a
"Chat-Box" node and typing "/HELP" for help. For more info, or the
location of your nearest "Chat-Box", ask your local Packet-Radio guru.

Some nodes containing a "Chat-Box" (Conference Bridge):
4Z4ZQ-1 IW5DAM-7 K2CC-2 N2NON-1 N8FOW-10 N8GNJ-8
N8KHN-2 OH3RBR-3 OH7RBA-3 PI8VNW-9 PP5UF-8 RA3APW-7
VE7SFU VK1BUD-5 VK3ERM-7 W8UPD WA2HEE WA7SLG-2
WB3BOI VE2UMS-5 (VE2VAX)
(some maybe's: PY2BJO-5 VK2PK-5 W5GB-9 WB9UUS-2)

NOTE: Not all the nodes mentioned above were tested, but taken
from the resourcelist, version 1.12 1995/04/05 07:57:34.
Check if the "Chat-Box" you connected is global (not local!).

3. Our FBB-BBS, which is connected to the am.network via our node,
doesn't only accept the personal addressed mail for some groups (1).
Both personal mail for PA6WSJ and the SCOUTS bulletins are accepted
and can be read by the operators/scouts in our tent.

4. Beside these activities other are possible, depending on the time
the operators have left.

Scouts can also send (censored) mail via OM/(X)YL's to their troops
at home. Don't forget to give your electronic address to your group,
if you like to get mail during the Jamboree....

Scouts on-site active on the "Chat-Box" can be used to entertain
a troop scouts at home (with the presence of a radioamateur
of course), giving them a bit of that "Jamboree Feeling".
Please contact us if you got some plans....

When you can reach our node with direct- or network-connect, chatting
with a operator/scout is possible (PA6WSJ-12), but mail or chatbox
is preferred.

Tech-info:

Our node PA6WSJ-9, running chl-NET, is connected to (and accessible for
other radioamateurs) the amateur PacketRadio network via PI8WFL. Local
node uplink PA6WSJ-9 at 430.825. BBS PA6WSJ-11 connected to the node.
Direct chat/connect is possible (see 4) trough PA6WSJ-9 to PA6WSJ-12.
Address for mail and personal addressed mail(1): PA6WSJ@PI8WFL.NLD.EU

For questions mail to:
Internet: bas.mastebroek@giga.iaf.nl
(Pse NOT to fellow OM and news-mailer ringo.xs4all.nl)

PacketRadio: pe1oov@pi8daz.#twe.nld.eu

Best regards,
The operators.

PacketRadio team of the 18th World Scouting Jamboree 1995
at Dronten-Netherlands.

2975. more Phone modem ----> Packet stuff

Newsgroup: rec.radio.amateur.digital.misc

From: hartzeld@cc.sdstate.edu
Message-ID: <3tjvva$4qp@ganesh.sdstate.edu>
Source record: 42562

Thanks to everyone who helped. So what are the exact protocals used?
Bell 202 FSK?

Does anyone remeber seeing an add by Alltronics (I think in Nuts and
Volts) about a kit sold containing a phone modem and some spare parts and
claimed you could run packet? The add didn't seem to run very long.

BTW, I have two Gandalf LDS 120 dedicated line modems. It is set up I
think for RS-232, and it uses four wires, two for RX and two for TX.
Does anyone know what protocal might be used? I know it's a long shot,
but I like messing around with this stuff!

Thanks, Dave N0TGD

There's quite a bit of 1200b TCP/IP activity on 144.93. From my vantage point (in Sherman Oaks), most of it seems to be in the San Fernando Valley, but I believe there are also TCP/IP'ers in Riverside and San Bernardino on .93 as well. There is also some 9600b TCP/IP activity, if I remember correctly, on 144.99 and 439.025...

> Also, are there any "Elmers" that can tell a newbie get up and running on
> TCP/IP on packet?

I'm sure there are - you might check the ELMER list that gets sent around the ax.25 BBS network from time to time. AX.25 bulletins to TCPIP get echoed into our NNTP system (which probably, by now, spans just about all TCP/IP activity in the greater LA area) - if you post a request there, you may well be able to rustle up a response from someone nearby as well. Failing that - email me, and I'll do what I can to help out from up here...

> Is there anything close to a plug and play NOS for TCP/IP packet? If so,
> what is it and where can it be downloaded from?

I started out with the NOS-GAS package on ftp.ucsd.edu - since then, I've played with WNOS, several JNOS variants, MFNOS... I still think the NOS-GAS package was about as close to plug-and-play as *NOS gets...
[I'm using Linux now... IMHO, *that's* the way to do TCP/IP! 8*)]

>Thanks to everyone who helped. So what are the exact protocals used?
>Bell 202 FSK?
Packet uses AX.25, which is a modified version X.25 network protocol. The
protocol has a starting flag, address frame, data frame, ending flag. BELL 202
uses 1200 & 2200 Hz tones.

If you just want to do plain AX.25, then a terminal emulator program
is all that you need. If there are other people in your area doing
TCP/IP, then you may want to do that. (Talk to them to find out the
benefits/drawbacks.)

It may work fine on MS-DOS, but the port that I tried was functional
but wants a lot of CPU time. If you've got ROM version 2.04 or above,
I would recommend that you get AmiTCP and the AX.25 network driver
(both available from an Aminet site).

I've redirected followups to comp.sys.amiga.newtorking since you will
get more help with the AmiTCP package over there. If you want to talk
AX.25, then followups can always be directed back.

============================================================
Hello and thankd 4 reading this messahe
============================================================

Maybe this is not the right place to post this message but i dont
have any
other choice.
I have a KENWOOD transceiver TS-450S/AT .
and my antinna is one element rotary dipol by cushcraft.
Recently i noticed somthing. !!!
when i press the antinna tuner button it start tuning as ussual then
complete tuning withen few seconds.
when i start talking the SWR jumping up but not all the times it
works fine
for few second then goes wrrong then again works great and so on...
to locate the defect exactly wether is it from radio or from the
antinna
i change antinna with a dipol and it works great no problem at all.
i turned back to my rotary dipol and inspected the coax from both
ends
i did not find any thing wrrong.
the problems might be from the TRAPS i have tow traps each side.
do u have any idea how can i recognize the defected traps ???
and from the above where do u think the problem.???
Pse leave a message or just send me E-mail my address is below.

RED CROSS/SALVATION ARMY
ACCUSED OF LOOTING MAIL OF OKC BOMB VICTIMS

In an OKLAHOMA Special on WHRI shortwave (9495.0 Mhz - 06 July 1995 from 14:00-15:00 EST) the grandparents of OKC bomb victim EDYE SMITH , GLENN and CATHY WILLBURN made wide ranging accusations of parties from the Red Cross to Oklahoma Governor Keating in the OKC Bomb affair. In conversation with Chuck Harder of the For The People Organization:

- GLENN WILBURN said he had confirmation that a bomb threat was made to offices in the MURRAH Building and Agents were given the option of coming in to work on 19 April 1995.

- Said all mail addressed to EDYE SMITH had been diverted to the Red Cross and all mail had been opened when they recieved it from the Red Cross.

- Said all cheques and cash was gone from all mail they got from the Red Cross and pages of letters were missing.

- Said mail that came thru OK Gov. Keatings Office had some cheques but all mail had been opened before being forwarded. Cheques were stapled to letters which came via this route.

- Said some friends had written cheques to EDYE SMITH and sent them to the SALVATION ARMY who when called refused to give her any of the money and told them it could not be taken out of thier general funds.

- Said only a $900.00 monthly check came from the Red Cross.

- Said all victims had recieved the same treatment and they all had reported opened mail and missing cheques or cash sent to help them.

- CATHY WILLBURN stated all families were being treated like they were "on welfare" and had to "go from line to line with hands out" to ask for help and were being refused assistance.

- Anyone who sent a cheque or cash to is asked to photocopy the check stub and send a copy to the Willburns directly. The Postal Inspector has made no indication that they would investigate the thefts.

Mail to: Bomb Investigation
Box 700012
Oklahoma City OK 73017

AMERICAN RED CROSS 111 E 9TH AVE STILLWATER OK 74074 (405) 372-1833

- EDYE SMITH said that the media was not covering all things and things were left out. She also stated that ex-FBI Agent Governor Keating was "making fun" of her and her request for an Independant Investigation.

- In regards to the 4000 Lb. fertilizer bomb, she said "I just don't think it could have happened that way".

- Reporter J.D. Cash said that they had a report being published today that a GSA hired employee said he helped the BATF clear explosives from their "magazine" in the Building 2-3 weeks after 19 April 1995.

- Ted Gunderson said that MCVEIGH had been a bodyguard for USARMY Gen. Norman Shwartzkopf when he was in the Military.

Other guests are former FBI Los Angeles Station Chief Ted Gunderson, Brig. Gen. B. Partin, OK State Rep. Charles Key, etc.

I'm too lazy to use Email today...

There's a program called FFTMORSE or similar, available from a lot of
ham-oriented BBS's and probably some of the ham web sites. It uses
a serial port with about $5 worth of hardware for use as a crude but
effective audio spectrum analyzer... is this what you need? If so
I could dig it up and Email you or put it on my FTP machine Monday when
I'm not feeling so lazy. 8-)

2983. TNC design

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-08 00:00:00 UTC
From: jesus@simu1.ele.cie.uva.es
Message-ID: <3tlf67$9fn@maggie.cpd.uva.es>
Source record: 42570

Hello.

I have started to design a very simple TNC that can only must implement the KISS protocol. I have built some microprocessor prototipes, but i'm a beginner in the packet radio, so i make this post looking for some suggestions about their design.

The first TNC try can include:

Z80-A CPU (3.072 MHz)
8Kb EPROM (or it must be more?)
8Kb static RAM (or it must be more?)
TIMER 8253 (3.072 Mhz)
Z80-SIO/0

The CPU and Timer clocks are selected in order to easily provide the common transmit speeds (1200, 9600, 19200), meet the limits of the CPU (<4 MHz) and to reduce my particular stock of 6.144 MHz Xtals :)

The TIMER provides the clocks for the 2 serial channels of the SIO and a periodic interrupt (NMI). This interrupt can be masked by means of the Timer gate input.

The Z80-SIO has 2 serial ports. Port A is intended to do HDLC and port B RS232. These ports are interrupt driven (INT) and vectorized (IM 2) to get a quick response time.

A obfuscated point is the one related with the maximun interrupt rate that can be handled with this slow CPU. With the HDLC channel running at 9600 bps, and the RS232 channel at 19200 we can get a maximun 3120 irq/sec. This means an average time between irq's of 980 CLK cycles, so, the interrupt code must be as quick as possible.

The Hard work is the related with the Soft :), I have some information about HDLC, bit stuffing and AX25, but none about KISS. I'll need the KISS protocol specs to write the firmware, so any ftp or web site is wellcome :)

If this monster is made to run sometime, the hard & soft shall be placed in the public domain.

Best regards & 73

Gidday,

The above text is getting a bit confuseing .. now I am not sure who wants to
do what .. I am running Warp and doing the following .. without any probs.

I have JNOS running in a DOS session CONTINNUALLY 24 hrs / 7 days ..
TCPIP / AX25 .. no Netrom (although configureable) ... while NOS monitors
the radio at 4800 baud .. I use the "WEB EXPLORER", NSUITE, NEWS READER
and FTP .. I also do the usual things with the MSoffice Suite etc.

The reason I went to OS/2 when all the other guys around here went to Linux
was to be able to use the Windows Progs. and have TRUE multitasking capability
for my Ham Radio Hobby.

What I would like to do is to be able to run NOS/JNOS/PMNOS or some native
OS/2 program for the Radio. My experience has been that the native operateing
systems programs work much better with less overheads.

Anyway .. guy's ... don't know if what I am doing relates to what you are
interested in .. if so .. and I can help .. pls. advise. .... Cheers/Beers/ 73's

Use a Z8530 instead of the timer and SIO. This has baud-rate generators
built in and will also handle NRZI directly, which the SIO won't.

Source record: 42579

I've recently been spoiled by having 128kb connections to the internet by getting ISDN installed to my house. Unfortunately, I've also become disgusted with 1200 baud packet on 2 meters (no, I'm not even using TCP/IP yet). I've decided that I need to get caught up with the rest of the world :).

I know that I'm going to have to get a different radio and most likely move to 440 (where I've never been), as well as get a TNC with much more capability than my PK232. I recall hearing about people running high speed backbones at 19.2kb or even 56kb. I'd like to get equipment that is eventually upgradable to that kind of performance, rather than ditch everything like I'm going to have to do this time.

1. Recommendations for radios that can switch quickly enough?
2. Recommendations for TNC/s and/or modems?

Any info or addresses for manufacturers would be appreciated.

Oh my goodness! Where did Jesus pick up such bad habits? It appears he is
designing BEFORE building. Keep up the good work.

980 clock cycles is actually a real long time, but how many machine
instructions does that work out to? Keep your interupt task simple, grab
the data, copy to a buffer, clear any error, and return. You shouldn't
have any trouble then.

> If this monster is made to run sometime, the hard & soft shall be placed
> in the public domain.

Thats nice. As public domain a manufacturer might adopt it and large
quantities may be produced. On the other hand existing TNC-2's are
practically public domain except for the standard software and barely
differ from your hardware description. KISS software for the TNC-2 is
public domain, right? Or at least freely copyable.

KISS documentation can be found at ftp.ucsd.edu/hamradio/packet/... and
somewhere thereabouts you'll even find KISS in Z80 for TNC2's. Should also
check TAPR at ftp://ftp.tapr.org/tapr/

My experiences with the Salvation Army Team Emergency Radio Network
(SATERN, to get this back on the amateur radio track :-) sort of confirm
this. Those Christmas kettles don't go really far when the money is
stretched out over an entire year, so they can't provide hotel rooms,
loaner automobiles, chauffeur service or shiatsu massage. However,
they do go out of their way to get food and clothing and temporary
shelter where it's needed most, and I know that that has been the
objective of every action our SATERN unit has taken during emergencies
such as the Plainfield tornado several years ago. Well, every action
except the handling of health & welfare traffic.

I suggest you try one activity with a SATERN unit some time and see them
in action for yourself, especially if an emergency situation presents
itself. I think it might change your opinion.

>I should buy the DR-610? The DR-600 will work fine for packet? Help please!

My advice is don't buy a radio for 9600 bps packet. Buy your radio for the voice features you want. If you want to do 9600 packet, buy a TEKK. These little radios are perfect with a beam to a 9600 repeater. If there is no 9600 repeater in your town, or another experimenter, don't waste your money till there is.

I've worked a lot with 9600 and it is finicky as hell. It requires good RF links, as opposed to the half-assed stuff that works well at 1200. If you want to stretch the range, be prepared to lose the data more often than not.

>1200 baud port connected. When I disconnect 1200, 9600 works Great!!
>I don't understand...
>Can anybody Help?
>Ben ae4ew@roanoke.infi.net
First Make sure the following commands are set:

CD software/internal
Oneradio ON
Fulldup Off

Next, connect the 1200 baud side to MIC connector,
and the 9600 baud to the 9600 connector. Do not
connect both 1200 and 9600 to the 9600 connector.

Make sure the squelch is set so a signal just breaks it.
This is where it gets touchy. If the other station is fast,
and your squelch is slow, it'll clip the data.

Check the manual for your I/O card. Most (not all) these days
allow you to select the IRQ for the com port. IRQ-5, 11, 7, are
usually unused, or used by printers (LPT port).

Selection of the IRQ for the com port on the I/O card can be by
software, or more likely by shorting blocks and in most cases will
be near the area where you select if the com port is active.

Also check the same with your Modem, the modem com-ware, and the
TNC com-ware. If the com-ware will not access the IRQ then you
cannot use the IRQ with out patching the com-ware. You can set
the IRQ for the com port in windows.

Also check your mouse, it may (but probably not) have a selection
for a different IRQ.
de Shawn, N7XBM.

Sounds to me like you need to get a modem that will use either
IRQ5 or IRQ2 (unless you have conflicts there too) The problem
is not with the com ports per se, but with the "standard" IRQs
for the COM ports - COM1 or COM3 usually use IRQ4 and COM2 and
COM4 usually use IRQ3.

You could shop around for mouse software that will allow use of
other than IRQ4, I ahave solved my own similar problem by
plugging my SupraExpress 144i Plus modem for IRQ5, works fine here.

Hello OMs,

Just a note:

To get help on this, you might try subscribing to the appropriate
discussion list - Send an e-mail, sans sig, to listserv@ucsd.edu
with a single line containing "lists" or "info" or "help". You want
to subscribe to the list "tcpip". Send e-mail, per the instructions
you get back, to subscribe and post your questions there.

I think it would be great to run "pmnos" (e-mail me for the ftp site
for this) for landline internet access, but I need to get more info on

the proper config file and dialup script and sometimes user info is
hard to come by. Generally, there's been a lot more interest running
an rf bbs and, also, programming and compiling versions of the software.
Pretty technical stuff. But they're a great bunch of folks, and I realy
ought to re-subscribe.

There are a few good books on the real guts of tcpip protocol that
would be a big help for configuration. The arrl infoserver also has
some tcpip faqs, also. (send an e-mail to "info@arrl.org", sans sig,
with "send index". Follow the instructions.

Hope this helps some.

73 to all,

Larry Braden KC5CWG

3019. UltraPak 2.1 colour problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-10 00:00:00 UTC
From: Tim Kearsley <Tim@cirrus.demon.co.uk>
Message-ID: <805360716snz@cirrus.demon.co.uk>
Source record: 42506

Hi all,

It has come to my attention today that a few copies of the UltraPak file distribution have "escaped" which have an old version of the THREED.VBX file included. The symptom which this causes when the program is run is that the status displays which are 3-D panels are white rather than grey, with the result that the program looks terrible!

If anyone has the program on trial and has this effect, you need the THREED.VBX file which is dated 17/07/93, size 64432 bytes. If you have difficulty getting it, I will gladly forward a new file distribution on receipt of a s.a.e.

My sincere apologies to anyone who has been affected by this.

I have a question.

Which of the above group is best at
fixing acoustic phonographs?

Are they better at it if they work on it two at a time?
Can they insert a 2A3 into the proper socket?

This is NOT a correct statement. What Apple wrote in their petition is: "Because NII Band technologies generally will be a more hospitable 'neighbor' than ISM devices ..., the NII Band allocation likely will not adversely affect existing radiolocation or Amateur operations." Apple absolutely HAS NOT proposed to take this band away from Amateur use. Jim Lovette, author of Apple's petition, has a rusty ham ticket in his background although he is not currently active. He has worked cooperatively with the ARRL in recent FCC rulings concerning Part 15 usage of the 902-928 MHz and the 2.4 GHz band.

The 5.7 GHz band is already a shared Part 15 band. Apple's NII petition is basically an enhancement or extension to existing Part 15 usage. The petition does not now specifically give technical requirements to the proposed usage but it would appear to be basically low power devices (like Part 15) but with directional antennas allowed.

I can hardly call this a "taking" of the 5.7 Ghz Amateur band.

Our best hope for continued access to UHF spectrum is to share our allocations. Commercial interests don't particularly want to have shared bands. All Amateur allocations above 420 MHz are today shared bands. And remember that between 1980 and 1989, we lost an average of 9 MHz of spectrum each and every year. 1989's loss of 220-222 MHz made 1989 a fantastic year for ham radio - only 2 MHz lost!

>I should buy the DR-610? The DR-600 will work fine for packet? Help please!
>
You need to tap into the discriminator for receive and past at the modulator for
transmit for 9600. The 9600 "ready" radios typically have a separate
connector for packet. Don't expect any of the to be "plug and play."
You will still have to calibrate your particular TNC/radio combo.

BTW, the DR-600 might not work for 9600 since it's a PLL synthesized radio.
I was trying to get an Azden PCS-3000 (1970's vintage synthesized) to
work at 9600, but the PLL tried to follow the modulation I was injecting
for the data output and "correct" the frequency :-(I ended up with
a Motorola Mocom which I had to modify with a wire right to the crystal
oscillator to modulate it.

If you are getting a new radio, I would suggest:
1) a true FM crystal radio (the Mocom mentioned above was phase mod)
- I've heard the MFJ data radios are pretty good..and for only $119 plus
crystal....
2) a new radio with 9600 capability. This way you can be reasonably sure
the manufacturer took into account the modulation and bandwith required
for 9600 packet.

Good luck & 73,

3024. Otaku? (Discovery Channel)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-10 00:00:00 UTC
From: sww@csuohio.edu
Message-ID: <1995Jul10.053041.25869@news.csuohio.edu>
Source record: 42511

I was watching the Discovery Channel. They had a group of younger adults who they were featuring as being very, very technically advanced. These folks, dressed in black leather and with hair styles designed to cry "different", were obviously hams.

During one part, the interviewer compared address lines on his business card with the Otaku (what they called themselves) spokesman. The spokesman rattled off FAX, Internet, land line and _packet_ address lines.

So who is Otaku? Why do they call themselves that? Why did they discuss being led to technology by CB and then never get around to mentioning real radio exists? Are they but a 2600 refugee group? They don't seem to have a presence on the net ... the real net, not Internet.

Perhaps this is in vain. The show was on at about 0300 local. They are probably all grown up pushing little Suzie's stroller to Johnny's little league game.

From: bobm@mindspring.com
Message-ID: <bobm.4.001A9969@mindspring.com>
Source record: 42512

I've seen several requests lately for sources to obtain
obsolete parts. I've come across these two vendors, I
don't know what they accept as minimum orders.

Rochester Electronics tel: 508-462-9332 fax: 508-462-9512
10 Malcolm Hoyt Drive
Newburyport, MA 01950-4018

Rochester has contracts with AMD, Intel, Harris, National
Semiconductor, Microchip and Texas Instruments to stock
and manufacture obsolete IC's.

Linear Systems tel: 408-263-8401 fax: 408-263-7280
310 South Milpitas Blvd
Milpitas, CA 95035

They manufacture replacements for discontinued discrete devices
from Motorola, National Semiconductor and Siliconix.

I haven't found a source for obsolete Zilog parts yet...

>This is where it gets touchy. If the other station is fast,
>and your squelch is slow, it'll clip the data.

I use a KPC-9612 with two seperate radios. The 9600 performance isn't great,
but as far as I can tell, it isn't affected by the presence of signals at the
1200 port.

With CD set to SOFTWARE/INTERNAL, it is *not* necessary to use the radio
squelch on either port. Turn the squelch control fully counterclockwise so
noise is always received. The TNC will differentiate the data signals from
noise and activate the "RCV" lights when apropriate. (Setting CD to EXTERNAL
on the 9600 port will prevent this port from receiving anything unless
external signals are applied to the DCD input there.)

Even if two radios are used, since one radio may desense the other, setting
ONERADIO ON is generally useful unless you're sure no desense problem exists.
If you are using one radio, summing the signals from both ports into the
"Data" connector on the radio would probably give better 1200 performance,
rather than bothering with the microphone connector at all. Adjusting the
bias on the 3105 demodulator chip can optimize 1200 reception. This will
require adding a pot to the TNC as Kantronics didn't include this very
necessary adjustment.

I have designed a better 9600/1200 modem for TNC2's. E-mail me for more information.

[Important stuff about changing com port IRQ's axed]

If you use MS Windows, many apps use the settings from the control panel to set the port addresses and IRQ's. So after changing an IRQ, be sure to go to Control Panel : Ports : Settings : Advanced and set the IRQ numbers to conform with your hardware. I use COM1:IRQ4, COM2:IRQ3, COM3:IRQ9, and COM4:IRQ5. Whoever thought that COM ports could share IRQs clearly had no clue, but it became "standard".

Here's what I got when I asked the same question:

Packet ready means that the radio can switch fast enough and may even have
a jack on the back of the unit to make your packet connection. Most radios
make their connection through the mic jack. There are no radios with a
TNC built in.

Hope this helps.

>in the dark ages with snail mail?
> thanks, 73, de KB8GG -

Dear KB8GG,
If you will look in the front of QST, page 3, you will find the address
of the ARRL. The ARRL will be happy to send you the 610 for your address
change. Also, when your ticket comes up for renewal, they will send you
the 610 without your having to ask for one (if your a member).
. Nice bunch of guys up there. W5YI will send you one also, but he
wants 5.00 to file it for you, after you have filled it out of course and
mailed it back to him. Kinda silly isn't it to send W5YI a fin to mail
the completed form to FCC when the FCCs address is on the form, the
specific address for renewals/change of address at the FCC.
And no, the FCC is out of the dark ages for some time now. My renewal
took 9 days for turnaround, neighbors took 7 days for his address change.
You can FTP to fcc.gov, web it, telnet it.

good luck es 73

It was added to TNOS 1.15 which was released as TNOS 2.0. Check
mwmicro.com in the /pub/linix/tnos/current directory for the lastest
code.

Can I get a Windows (or OS/2) version of APRS? Several months ago, I
heard that there was someone working on this. I'd like to look at an
ALPHA or BETA copy if possible. Thanks.

3039. Packet interface for a mobile ROBOT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-11 00:00:00 UTC
From: ghassempoory@cf.ac.uk
Message-ID: <DBK4A4.IBH@cf.ac.uk>
Source record: 42526

A friend of mine is developing a mobile radio controlled robot. He has developed some software for control and status report. He is now trying to control a number of robots on the same frequency. I think this is where packet radio will be useful.

His robots are very small and can not carry a lot of equipment, since he has been using a 386 CPU for the robots, I thought there may be some free software out there which combined with the right drivers will make his task a lot easier. Does anybody know of software capable of doing the job? Remember that his robot has to do a lot more than just communicating with the master computer, so whatever he uses must be capable of being integrated into his existing software. Any Ideas?

The other alternative would be to piggyback a small TNC on his existing circuits. Are there any public domain design of TNC boards which will will be small enough (2"x2") for his application?

Please let me know what you think.

3040. Anyone using a Kantronics KPC-3 TNC??

Great TNC! The only other things you'll need is a serial cable and
the cable that goes from the radio to the tnc. MFJ makes premade cables
for nearly every radio and they are fairly cheap in price. The KPC-3 is a
GREAT little tnc. I love mine.

I have used a HTX-202 with a Tigertronics Baycom type
modem and it did OK. You can usually find a used KPC-3 for
not much more than the Tigertronics and it is a lot more
TNC thus you need much less computer. Any old dumb terminal
will suffice. I resent tying up an entire computer for the
baycom but I do use one when traveling but the thrust there
is size and weight. DO NOT use a rubber duck particularly with
the baycom it does not like RF. I use a tv twinlead J-pole with
a few ferrite beads even indoors. The commercial one I like is
the Pico J advertised in QST and such. Well that's enough advice
for one day. CUL 73 de JERRY

At the usual retail price at around $110-$120 new, that's a great price...

3046. Anyone tried phone modems/chips for packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-11 00:00:00 UTC
From: erb@inss1.etec.uni-karlsruhe.de
Message-ID: <3tuq7f$osb@nz12.rz.uni-karlsruhe.de>
Source record: 42533

Hi,

just wondering.. nobody tried this? I can't find anything on the newsgroups.

I'm not talking about old 1k2 stuff but the newer 14k4 and up.. 28k8
modems are really cheap today! With a dedicated fullduplex link this
should be no problem, or is it? I know someone who did 4k8 with an ICOM
IC4e (430mhz) and a rockwell fax-chip.
For 28k8 they need about 3khz bandwidth. TRX for dedicated links are
usually much better, S/N is also very good for this interlinks..
So it may work. (usually we have FSK with g3ruh/k9ng(?) like modems).

I'm asking this because I don't want to buy the modems and lose - maybe
we've phase shifts or something like this where FSK don't care, but
QPSK (or whatelse they're using..) does..
Maybe it'll work with out-of-the-box trx' on the speaker/mic jack?

Any experts here?

73,
Olaf

I found the ARRL book, "Packet: Speed and More Speed" (I think that's the name)
and found quite useful for 'moving up'. Its only about $15 and has info on
56Kb and 10Mb modems as well as 9600 and other good technical info. While
alot of info can be found on the net, its real handy to have so much good
resource info in one place. Its a good starter book for those upgrading out
of 1200, IMO.

> thanks de KB8GG - LanceEND -- Cut Here -- cut here

You can thank IBM for this mess - they established the shared IRQs.
I spent some time looking for a solution and ended up buying a dual
serial card that could be configured for COM 3 and COM 4 and IRQ 10 and
IRQ 11. It was about $60-$70 - they are not too common. I am at work
and do not have the info here. email me if you want a pointer.

Note that this will work only if your software can use the
higher-numbered IRQs.

The next motherboard I buy will have a mouse port. THat will free up a
serial port (or I will buy a Kensington track ball that has it's own
card).

Source record: 42446

This week I tested an Alinco DR-610 dualband tranceiver.
It should be 9600bps packet capable, but the TX BERT is very bad.
In the leaflet under 'Wide Range of Outstanding Features' they
say: 1200/9600 bps packet capable (GMSK type TNC required)

Now I know little about GMSK, and have never heared of an GMSK TNC.
So, can anyone tell me more about GMSK, and if there exists an
GMSK type of TNC modem?
Due to the bad performance I recon that GMSK is not compatible
with G3RUH FSK at 9600bps.

Ok, hopefully someone can provide me with some info.

: Michael Wimble
: mike_wimble@taligent.com
Which tnc? I don't think "host mode" is generic unless you are talking
about kiss, which is described somewhere on ftp.tapr.org

Kantronics has a host mode that is different from AEA host mode for the
PK-232 and the PK-900 host mode is a superset of the 232.

Jim.

Jim Goedhart (jim_g@ix.netcom.com) recently wrote
in <3u0k9a$roo@ixnews4.ix.netcom.com>:

: You know, I have never had any luck getting into muncey.com. I haven't
: tried it recently but anyone else have this problem? Actually I connect to
: but it just sits there with nowhere to go as far as directories. It says I
: can go back one but that just produces some kind of error.

Muncey.com is an amateur jnos system and works if you do a real FTP. My web
browser fails to read the jnos directory structure as well.

You might try

http://www.ccnet.com/~rwilkins/aprs.html

There are pointers to all the FTP sites as well as the MacAPRS Home Page.
There is additional information for APRS users in Northern California.

ftp.tapr.org is the best FTP site as they get the files direct from the
authors. Remember the latest pc files are always in alpha, you know early
beta. See you on the map.

Have Fun!

I had the same problem with my 202 and the baycom. Check the wiring. It
may be backwards from the way the telephone cord is. I switched
everything around and had no problems since.

Here are the connections I use for a standard telephone wire:

Green (not connected)
Red speaker center
yellow speaker ground
black mic center

This should work for ya.

>find it!

Sorry 'bout the addr mixup....here's the text I got...

Subject: Re: Re: Soundblaster CRO

I have posted it in the public directory of the gateway here in town.
You can log in as anything to download it.

The filename is fftscope.arj and it is about 100K long.

You can FTP connect to either une.vk2djg.ampr.org (44.136.32.1) within
Amprnet or vk2djg.une.edu.au from Internet (the same machine)

I just had another look at it and am impressed once again. You can do
accurate measurements and I especially like the spectrum analyzer
functions.

Have fun!

73's from Bob in Armidale NSW Australia.

>
>73/George
>
You know, I have never had any luck getting into muncey.com. I haven't
tried it recently but anyone else have this problem? Actually I connect to it
but it just sits there with nowhere to go as far as directories. It says I
can go back one but that just produces some kind of error.

I'll try it again but just thought I would mention this while I was thinking
about it.

I have 2 of them and wouldn't sell them for anything. Well.. Slight
overstatement but they are a great tnc and the $65 is a good price. Most want
$90-100 for the things used, which is way too much I think.

Also get PaKet for a terminal program to use with it. Goes real nice with
all the kantronics tnc's.

I am also running JNOS with a kpc-3 in kiss mode and it works great.

: thanks in advance for the info!

I'll take a shot.

APRS is mapping software that works over packet. Stations running APRS announce their logitude/latitude over packet, and other stations running APRS see where they are located. The software can take direct input from a GPS receiver. There is also a nifty tracking capability where you can hook up a modified Roanoke dopler unit(one that is spitting our RS232) and get tracking information for T hunting illustrated on the map(and sent to everyone else).

There is software also supplied that allows you to create your own maps so you can make it as detailed as you want for your local area.

This is one of those killer apps for packet that has a lot of use beyond it's original intentions. The best example I can give is the large number of ways this can be used in emergency services work or public service events.

3063. New? Idea on HF FAX demod?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-12 00:00:00 UTC
From: tfugate@uklans.uky.edu
Message-ID: <3u0o0j$666@service1.uky.edu>
Source record: 42540

I am in the process of getting JVFAX to communicate wiht my A&A NOAA demodulator. I am using the printer port and was amazed to fine bit 7 is inverted from bits 3,4,5 and 6. But after getting that "solved"(?), I got to thinking about HF fax reception. I have been using the "simplest" opamp comparator circuit. While it does work quit well on 8080, it really falls apart on a signal with any interferance or that is weak.

I got to thinking about the old mainline RTTY terminal units. Wide shift RTTY was (is?) 850Hz, And HF fax is about the same (2300white-1700black=600hz). Has anyone any expereince using a torroid based discriminator(spelling?) for HF FAX? It seams that it should be fairly straight forward to do. Or would a CMOS PLL be a better choice.

I will try to cob a circuit togather and test it in next few days. If there is any interest I will post the results.

>I have seen alot of messages about APRS. So, what is it?

>Anyone care to define in a single sentence?

The program displays the position of cooperating stations on a map.
The position data comes from GPS or Loran receivers, or from manual
entries by the reporting station operators, and is transmitted by
packet radio as UI frames. It has several uses. The most impressive
is tracking of mobile sources, such as high altitude balloons.
Other obvious uses are for discovering the geographic locations of
a group of stations, such as during a public service or emergency
event, or for building up a map for antenna pointing purposes of
the local network.

Francis A. Ney, Jr. (croaker@access.digex.net) recently wrote
in <znr805576214k@Digex>:

: Point of Information.

: What specific use is station N6FRI making of the 5.7 GHz band?

While some Amateurs are willing to give up their spectrum to an unregulated "Part 16" environment, WE are using the band. N6FRI and other Amateurs have used the band since 1968 to intitially link their 2 meter and 440 repeaters. You may want to read the articles published in the ARRL QST for some information of the San Francisco Bay Area group of 5.7 GHz network Amateurs.

One good article was written about the use of 5.7 GHz in the cover story about the Berkeley Hills Fire. Amateurs were able to provide T1 service to the Incident Command Center located in the fire zone, miles from the nearest utility. This is emergency communications at its finest.

Amateurs were able to provide that "last mile of service" so commanders could communicate with their computers in Sacramento. All of this took place in an urban hilly setting as the fire storm destroyed over three thousand homes.

We have been doing what Apple and other market makers are dreaming of doing. Now would you be willing to give "Part 16" status to a one MHz window in the middle of the two meter band? Sure you would if you had no interest in the band. Lots of money to be made .. right?

Maybe some amateurs have a pecunary interest in moving to "Part 16" ?

>>> AN ERA PASSING
The first issue of MLH was distributed in January of 1993. Two and a half years later, I expect this to be the last MLHacker. I still use my minisports regularly, but the seasons change, time moves on, and other facets of life become dominant. I also picked up two broken laptops (a '386 and a '486), and, by mixing and matching parts, I have a '386 that is capable of taking over much of the Minisport functions. Prices are falling such that it's become reasonable for me to begin using a more modern laptop. The two minisports are getting attention from the kids. They have favorite CGA games, and they're beginning to call the Minisports "their" computers.

MLH has been coincident with me learning a lot about the Internet and Amateur Radio networks. After swelling my activities to the point where net surfing was all I was doing, I've shrunk back to a level where net access is a tool rather than a teacher. I need to get some work done in other areas!

Since making the MLH compendium available on Internet archives, I receive queries from around the world. Nonetheless, most of the questions are discussed in previous issues, giving further impetus to wrap up this project while it's alive and well, rather than fill more issues of MLH with fluff just to keep it going. If anybody has questions about the minisport, by all means contact me. Just because I'm not sourcing more newsletters doesn't mean I don't want to talk about them any more. I'm sure my contact information will change over the next 6 months, so you'll have to be creative tracking me down. The most reliable method will probably be to contact a local Amateur Radio operator and ask them to find QSL information or a packet address for KA9SNF.

I'll continue to publish in the electronics/radio magazines. I'll be moving to Colorado in August to attend a "prestigious" Space Tactics School put on by Headquarters Space Command. After that, I'll probably be permanently moving to Colorado Springs to teach at the Air Force Academy. God willing, I'll begin training as an astronaut sometime in 1996. Selection will be this Fall.

Please provide feedback! * Internet bmork@comtch.iea.com

Hi Mark,

Yes, that's a real waste of time and resources! Anyway, how come you
didn't get Amicom working for the KPC-3 ? I use it and it works fine!
You have to put the KPC into KISS mode and use KISS.drv on Amicom2.1.

If you don't figure it out, mail me and I'll send you my KISS.ini file.

All the best,

GMSK is a baseband modulation very similar to the K8NG/G3RUH
format; the different is the shape of the data spectrum.
In the amateur context, I've seen GMSK used to refer to the
any baseband 9600 modulation.

From: gjones@teachnet.edb.utexas.edu
Message-ID: <222122.ensmtp@teachnet.edb.utexas.edu>
Source record: 42457

TAPR is proud to announce the creation of:

ARRL Amateur Radio Computer Networking Conferences and
Digital Communications Conferences Index and Abstracts (Web Pages)

Abstracts form all thirteen ARRL CNC/DCC proceedings can be viewed from
either the Packet Radio Page, Virtual Library or via the TAPR Page,
Products, Publications area.

The direct link is
http://www.tapr.org/tapr/html/cncindex.html

This page has links to all 13 proceedings with abstracts from all the
articles. Search capability is in the works.

If you have a proceedings articles available on the Internet, please contact
TAPR about generating a link from the abstract pages to your pages.
Contact wd5ivd@tapr.org

TAPR currently has available all past proceedings of the CNC and DCC, check
our Web page for more information.

3071. Re(2): APRS 7.0 AVAILABILITY?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-13 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <222124.ensmtp@teachnet.edb.utexas.edu>
Source record: 42458

Just for all the APRS links to TAPR:

ftp://ftp.tapr.org/tapr/SIG/aprssig
http://www.tapr.org/tapr under SIGs

or the direct link:
http://www.tapr.org/tapr/html/sigs.html

The Web page also supports the ability to automate the listserv process for help, information, and subscription. (I guess I should add unsubscribe sometime :-)

The APRS SIG mail group is participating in the current Shuttle mission, so lurking on the group right now could be very interesting. They will be using the shuttle to conduct some APRS experiments.

I am attaching the standard blurb on the TAPR listserv.

Cheers - Greg, WD5IVD

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of
SIG groups, send an e-mail message to listserv@tapr.org with the subject
line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to
listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the

: >
: > I can't run COM2 and COM4 simultaneous due to IRQ
: > conflict -- can anyone give me some suggestions on how
: > to run both the modem and the serial port at the same time?

: Sounds to me like you need to get a modem that will use either
: IRQ5 or IRQ2 (unless you have conflicts there too) The problem
: is not with the com ports per se, but with the "standard" IRQs
: for the COM ports - COM1 or COM3 usually use IRQ4 and COM2 and
: COM4 usually use IRQ3.

To me more accurate, modems don't, per se, use an irq line. It is the
UART on the way to the modem. COM ports, when dealing at this level,
would be better refered to as specific hardware i/o addresses. The
relationship between COM# and hardware i/o address is NOT fixed. When
customing comm software, it's worth being aware of this. I'm *not* being
and idle trouble-maker here. I had *exactly* the same problem and
finally got everything working great using three different i/o addresses,
and irq lines 3,4,5.

: You could shop around for mouse software that will allow use of
: other than IRQ4, I ahave solved my own similar problem by
: plugging my SupraExpress 144i Plus modem for IRQ5, works fine here.

Ditto! About 7 people sent me mouse drivers that were suppose to use
"extended hardware" addresses and irqs. NONE worked properly beyond irq7.
I finally pushed the modem's (the associated UART in the serial port)
over to irq5. Works fine (as I type, actually). The mouse is still
working, and a packet radio program (TPK) is running in the background.

3074. OptoSCC card fabrication help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-13 00:00:00 UTC
From: negaard@draagen.graceland.edu
Message-ID: <NEGAARD.95Jul13152755@draagen.graceland.edu>
Source record: 42461

Thanks to the assistance of a reader of the r.r.a. newsgroups (thanks, jesus!), I have schematics and component-placement diagrams of the OptoSCC packet-interface card for PCs, designed by Henk Z. Peek, PA0HZP. The board looks simple enough, and will certainly meet my present and projected future needs (operating packet from Linux), but...

In the archive file that jesus (EB1DIX) sent me there are no etch patterns or layouts, and the e-mail address listed in the documentation for PA0HZP appears to be dated. Therefore what I'm looking for is a source for either:

a) patterns that would allow me to etch the board myself
b) a source for the board (at a low, _low_ price, please! ;->=)
c) a layout program that would allow me to design my own from the schematics (this had probably better be free)

and...a source or complete description for the 20L10 component (I _think_ it's a PAL, or something programmable). If I'm right about what it is, I'll also need some help programming it.

This is the answer, I can feel it...if only I can get a _little_bit_ more help. ;->=

Thanks.

I just bought a used one for $75 myself. It even came with the computer cable and a cable for my TH78a HT. I loaded Paket 6 software and in a few minutes, I was on packet. I have not been on in several years though and there a lot of changes since then. But the KPC - 3 seems great.

3079. Which tcp/ip packet nos?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-13 00:00:00 UTC
From: csp@prometheus.hol.gr
Message-ID: <3u26hk$hvt@newsflash.hol.gr>
Source record: 42466

I run Linux on my PC and I was wondering which tcp/ip packet util
would work best with it...
JNOS, Tnos, or WAMPES

I m not trying to put down any of the above variations; just want to get
an idea of the differences among them. So far I ve only used WAMPES, and
I really liked its server/client model.

Thanks.

don't use any of them! Get the AX.25/NetROM kernel patches so the
Linux networking code will interface directly to your TNC.

Howard, you can ftp the programs and the instruction manual from my
ftp site: ftp.cts.com/pub/fehner

Please read the readme file in the directory before downloading the
programs. When you are putting the files on your Commodore disk make
sure that you specify which file type the file is. ie. prg or seq.

You might want to go to the ftp.oak.oakland.simtel.msdos.hamradio
The address is close but probably not exact...There is a program there
called rttyg.zip or something real close to that. It is a good shareware
program written by Glenn Wellman KF4NB(deceased). If you can't find it
let me know and I will track down the exact oak address and filename.
Failing anything else I have a copy. It is a long program so I don't know
how to send it over the net. Maybe I can upload it to alt.misc.binary or
something like that.
You might also check out the shareware CD's in your area. It is on several
shareware CD's. Especially look at any hamradio CDs. I think Glenn's
program is perhaps the "standard" ham rtty program.

I wonder....Now that the US hams no longer are restricted to using ax25 to piggy back or encapsulate IP on/in U might want to use TNOS and experiment with direct IP over RF. That's if I perceive things as I think they are.

The book's not bad. However to attempt to directly answer the questions, let me say that neither voice grade radios nor TNCs are suited to higher speed digital operation. You need to discard both of these anachronistic ideas. You're not going to be able to "upgrade" ordinary amateur voice radios to high speeds. 9600 baud is about all you can realistically do with a voice grade radio, and even that becomes hard.

For high speeds, you need purpose built RF modems that *are* the radio, and you need digital pumps to drive them that aren't limited by the bottleneck of the TNC paradigm. Fortunately, this is actually a cheaper solution than trying to cram high speed data through unsuitable devices. For 56 kb, the WA4DSY (GRAPES) RF modem and an Ottawa PI2 card are the way to go. For 2 MIPS systems, Glenn Elmore's system is a way to go, and for 10 MIPS, you can try ethernet over microwave with the Gunnplexer circuits.

56 kb is the most realistic stepup at this time. The cost of a system is similar to that required for 1200 baud, IE voice grade radio, TNC,

and antenna bought for packet, but has 47 times the throughput. Naturally, the higher speed systems have to operate in *pairs* since they don't interoperate with low speed systems, so you need to coordinate the purchase of such systems with others in your area. This is perhaps the largest stumbling block to their wide acceptance, there is no backward compatability to them due to the different modulation encodings and different IF filter bandwidths required.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Mark,

In a sentence it would be difficult!

APRS is a packet radio software (1200bd AFSK) that transmits location data (via a GPS or manually entered) in LON/LAT and shows that information via maps....

Maps are available but you can create your own if you want more detail or if you can't find local maps of your area.

There are several uses for APRS; visual location of packet network nodes to determine best message forwarding routes, finding the location of hamfests, tracking balloons, etc.

In general, it is just plain NEAT to do!

Stations can show up (via their callsign) on your map screen as each TNC identifies. The software configures the beacon message in your TNC to transmit LON/LAT data so if you are moving other stations can actually track your progress.

It is the very same technology that rental car companies are now testing by putting a small computer screen in your car and letting you "see" where you are and where you are going.....

OK, so maybe I ran a "bit" over one sentence but in a nutshell that's my view of APRS.

>Maybe it'll work with out-of-the-box trx' on the speaker/mic jack?

To make phone modems work, you need dedicated full duplex links
of at least telco voice grade. The 28.8 kb systems actually attempt
to exploit phone line capacity *in excess* of the guaranteed spec,
so often don't work to their full advertised potential over real
phone lines. The same may be the case with analog voice radios.
28.8 kb is over the Shannon limit for the telco specification.
If you offer them a telco like link, they'll attempt to train
to the highest speed the link will support.

Amateur voice grade radios almost never have telco grade line
quality due to non-standard AF and IF responses and EQ. The
modems will attempt to train around this. The Telebit Trailblazer
DSP type modems operating in PEP mode are better at dealing with
these sorts of circuits than the new 28.8 kb modems with their
dedicated chipsets. And since the Trailblazers are being replaced
at most sites today, you can get them *cheap*. That'll buy you
up to 19.2 kb on your dedicated radio links at minimum cost.

Of course, use of telco modems is strictly a point to point activity.
Due to the necessity for training on the link, they can't realistically
be used in a typical amateur shared channel arrangement. That's where
you have to fall back on no-train systems like the G3RUH modems, and
fool around with the radios' responses to get them to work.

>1700black=600hz). Has anyone any expereince using a torroid
>based discriminator(spelling?) for HF FAX? It seams that it should be
>fairly straight forward to do. Or would a CMOS PLL be a better choice.

The Mainline TUs didn't use a discriminator. They used two filters,
tuned to mark and space respectively, and a slicer. This would
probably work OK for B&W FAX, but won't show any shades of grey. You
need a discriminator, or a PLL, to produce an analog output proportional
to the FAX tone frequencies in order to recover greyscale information.
The TU slicer can't do that. It can only toggle between black and white.

The opamp comparators count zero crossings of the audio signal.
That count, accumulated in software, is proportional to frequency,
and thus allows greyscale mapping. As you note, there is no
interference rejection designed into such a circuit. Any audio
in the passband, be it noise or signal, can cause the zero crossing
detector to register a count.

If you want to de-noise the signal, you need to apply DSP techniques.
There are no phase discontinuities in the transmitted signal. Phase
changes smoothly from one greyscale value to another. You can exploit
this coherence via DSP tracking filter functions to eliminate non-coherent
noise and interference in the passband. If there is a discrete phase jump
in the signal, it can be discarded since the transmitted signal must vary
coherently.

Basically, you implement a software PLL with an adaptive loop filter.
If you used a hardware PLL and loop filter, you'd smear edges in the
picture if the loop time constant were long, and introduce loop jitter
noise into the picture if the time constant were too short. By doing
an adaptive loop filter in DSP software, you can interpolate the phase
trend lines over a number of samples and and adjust the loop filter to
discriminate against noise and interference without excessive picture
smear or jitter. This works best if you can compare pixel values left

and right, above and below, the current pixel. This requires keeping phase information intact for more than one line of the picture as you receive it. No pixel value decision becomes "hard" until those around it are examined.

This technique is called feature extraction enhancement. It can be used to post-process received pictures, but it is much more powerful if the full phase information is retained rather than just working post-reception with the output of a hard decision detector.

: Allan N3TCM
Allan, Sure you can no problem. You don't need a $100 TNC to use packet
and the Baycom is a excellent terminal system and yes you can allow people
to connect and leave messages.

We have and are using V.29 fax modems as a data pump in a satellite application.

The short training sequence is bursted just prior to transmission.

This mode of transmission is being used in Japan. However the required signal to noise ratio needed must be greater than 26db and I don't belive it would stand up to multipath very well. However this should work with most radio's.

We also coded a DSP to train on the data or blind EQ using a Star Semi DSP now out of business.

Norman

Source record: 42399

I just picked up a Kenwood TM251-A 2 meter rig and a KPC-9612 TNC. I
am unable to decipher the Data connector pinouts in the Kenwood
Manual. This is what it says...
Pin 1 (PKD) Packet data Input / Transmit data from TNC to tranceiver
Pin 2 (DE) Ground for PKD
Pin 3 (PKS) Packet standby / TNC can use this pin to inhibit the
tranceiver microphone input while transmitting packet signals.
Pin 4 (9600D) Detects 9600 bps data
Pin 5 (1200D) Detects 1200 bps data
Pin 6 (SQC) Squelch control output / Inhibits TNC data transmit while
tranceiver squelch is open.

What in the world ever happened to simple instructions? On my 9612
I've got 4 pins to connect to. Push to Talk, Receive Data, Transmit
Data, and Ground. Ok... at least I can figure out which one on the
Kenwood is the ground. :) Info from anyone?

3113. Re: Apple Petition for Rulemaking "NII Band"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-16 00:00:00 UTC
From: Ed Mitchell <edmitch@accessone.com>
Message-ID: <3uboge$in5@pulm1.accessone.com>
Source record: 42400
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.digital.misc

I am personally aware of many companies that plan to build Part 15 devices in the 5.7 GHz allocation in the not-distant future. These devices will operate under existing Part 15 rules. Legally, they must not generate interference to other licensed users and they must accept interference from licensed users. In practice, that rule is already dead in 902-928 MHz from an Amateur standpoint. There are now estimated to be many millions of consumer cordless devices operating in 902-928. Politically, there is no way that Amateurs will tell millions of consumers to get lost even though we have the legal right to do so. Only the AVL
industry for a time got away with threatening consumers - indirectly mostly by telling retailers in some locations of the country not to stock 902-928 MHz devices since they were just going to be interfered with (and as best I can tell, the AVL industry is kind of fading
away since there are other, better technologies today to do vehicle location systems).

In a recently ruling, the FCC did give some "rights" to Part 15 devices at 902-928 MHz. In "our" 902-928 MHz band, co-primary users are ISM and AVL. Hams are "secondary" users. Part 15 users fall at the bottom of the heap. In their ruling (and I'm not a lawyer so anything I
say about laws is suspect - but what good are laws if none of us can understand them?), the FCC specified certain situations in which both Part 15 and Amateur operations are automatically defined as "not intefering" with AVL systems. In effect, they said that AVL systems will have to put up with a certain level of interference. I believe that Apple has seized upon this idea to create a Part "16" device category that could be "more equal" than existing Part 15 devices. But so far, there are zero technical details for the hypothetical Part 16 category. The basic idea, though, is that the band does not turn into "CB" because the sharing "etiquette" is built into the hardware devices themselves. In "CB" the sharing rules are whatever the users do; in the WinForum "unlicensed PCS" sharing etiquette, the devices themselves are constructed to cooperatively share a given spectrum allocation.

The point I'm trying to make is that our access to UHF frequencies is very tenuous. Every single one of our UHF bands is shared with other users. I've had to listen to PAVE-PAWS radar on 440-450; doppler wind shear radar on 448-450 and 915 MHz; I've "watched" microwave ovens on 2.425 GHz ATV repeater output; and I currently live north of line "A" so I've lost all of 420-430 MHz. By developing good sharing arrangements, we have better likelihood of retaining access to frequencies.

I wish we could have clear, big, frequency allocations. But the world is changing. There are
extremely serious proposals to abolish the FCC all together. Some proponents even suggest auctioning *all* radio frequencies. In such a scenario, it is unclear whether "free" users like us would even exist. Since the 1980's I've done a lot of shouting that threats to "our"
frequencies are genuine (here, to the ARRL directors, in other online forums, and even an occassional letter to the editor). There are solutions to retaining access. The ARRL has

successfully fought for Congressional resolutions, that while weak, to help us politically.
I do believe that the FCC of 3 to 5 years hence will be vastly different than that of today and we need to be preparing for that scenario now.

Another thing that we have going for us is that practically everyone in businesses that are building Part 15 devices is also a ham. We do care.

But realistically, I have to do what is right for my employer or they'd stop paying my salary. And that means writing comments that will help us create wireless data services (note that 5.7 GHz is not the only band of interest - these proposals are also looking at the 5.1-5.3 GHz area too). Sure, I could quit, but someone else will step in to my shoes, and then what will I have accomplished? My 3 kids will just go hungry... Instead, most of us, in that we are all hams too, are trying our best to craft rules that will help retain access for the Amateur service.

N6FRI's comments are very good; thank you for writing them.

Ed Mitchell
KF7VY
"These comments represent my personal views and not necessarily those of my employer."

P.S. By the way, I did read the article in QST about how the 5.7 GHz band was used for fire communications. Cool story! I too have been an active ARES/RACES team member since 1984 (ham
since '73) and have personally used ham radio frequencies on fire lines, over seriously injured parties, and in search & rescue situations.

KF7VY is too modest. His QST primer (as WA6AOD) on emergency communications was one of the best
the magazine ever published.

Hams who believe that Data-PCS/NII Band is merely a corporate takeover of ham frequencies would do well to consider Ed's comments.

I am considering the no-code option for a license. My background includes quite a bit of experience with a commercial FCC license so the technical exam is little if any problem. Code, on the other hand is a problem (I worked on it and tried but didn't learn very well at all.) I have 20+ years in computers and work developing commercial / manufacturing applications in Windows.

With my seemingly great demands for personal bandwidth (I am running 14.4 into a local number) I can't see operating below 6m anyway, so am I likely to find the no-code band allocations a limiting factor to enjoying radio? (I live in Troy, MI)

Given a 486 with 8Mbytes and Windows (95, maybe) what do I need to get on the air with the most bang for the buck?

I have seen a lot of references to Linux (I have already set aside 100MBytes of my disk space for a Linux partition and I have a CDROM version but have not worked up the courage to install it; preferring to wait for Windows 95 to get done with my system before I try. I've already decided that Linux could be fun, but have not found a good use for it. Seems that radio might be it.

Thanks for any advice or perspectives you have to offer.

>Jim
>K3QHO

Try ftp.tapr.org/tapr/SIG/aprssig/upload and you'll find what you're looking for. APRS71A.Zip is the most current complete package (although there's a new version every couple of weeks as features are added or fine-tuned). You'll also see files like 69to70.zip which are upgrade files for current users who only need recent changes. Be sure to use the -d switch for pkunzip to ensure you get the embedded subdirectories.

Best tip: the program can do sooooo much, and there are soooooo many features that while learning it in your own shack is not impossible, it's alot easier if someone using it walks you through some basic functions. Holler on the local repeater during the next net and find the local APRS guru...and if there isn't one, you're it!

There's also a list server at tapr for the APRS SIG. Subsribe to the list and see your mailbox fill every day with all kinds of info. I can't find my notes to subscribe, but as I recall a note to list.proc@tapr.org with the text "subscribe aprssig yourfirstname yourlastname" in the body of the message may do it. Hopefully someone else will jump in here and correct me if I'm wrong.

Jim,

You will need the APRS software. Depending on what you want to do with
APRS will determine what you need with your KPC-3. If you want to use a
GPS receiver, then you need to make sure your ROM version is at least
6.0. This provides the link required between your GPS receiver and KPC-3.

You can,however, enjoy APRS with only the software. This means that you
must manually enter your own LON/LAT. As you can see, this works fine for
fixed operation, but if you want the "full blown" system, buy a GPS, get
the APRS software and upgrade your KPC-3 ROM to version 6.0.

I am looking for assistance in solving my problems while "trying" to
operate a 9600 Baud tcpip station with the kantronics kpc 9612 tnc,
and the kenwood tm-733 dual band radio. I have had the equipment for
approx 12 months and I am still finding it very difficult trying to
communicate with local hams who are using modified PMR Equipment. I
have carried out the equalisation procedures as recomended by the
kantronics company but I am still having a very difficult time .
I would be interested to know if anyone has had similar problems ,
and if so how do you overcome them?, I am not sure which piece of
Equipment to throw in the bin , possibly the radio , I am led to
believe that this radio is NOT suitable for 9600 Baud Data
transmission at all --

From: kn4aq@aol.com
Message-ID: <3ucibm$eek@newsbf02.news.aol.com>
Source record: 42411

I've been using a KPC 9612 into a TM-733 at 9600 with reasonable success for some time now. I do have a problem: If I try to set the 9612's output level to produce the correct (3 khz) deviation in the 733, I get a squirrly, howling sounding oscillation from the 733. If I back the deviation to about 2 kHz, it sounds OK. I've been communicating with a local node pretty well.

There are some retries. QST ran an article about the "9600 ready" radios recently, and has begun measuring "bit error rate" for them. The 733 wasn't tested, but it's Kenwood cousins were. The kenwoods and most of the other radios showed some BER in transmit -- enough that about one transmission in ten will probably have a bit error, resulting in a retry. My 2 kHz deviation won't help that. The QST article showed most of the radio receivers were OK in the BER dept.

The Azden and TEKK radios, and the multimode Icom 820, were good BER performers.

Good Luck and 73,
Gary KN4AQ

From: john@wb5dgq.hounix.org
Message-ID: <1@wb5dgq.hounix.org>
Source record: 42412

For a Model rocket, the DC-X proved the basic concept of a SSTO. many
who wished to see the program fail, failed to derail it. All they did was
slow it down a bit.
it is treu that many crafts have launched vertically and landed vertically
but how many rockets have you seen that can HOVER.
IMHO, the whole concept of a SSTO, is not only can it go into space and
return without using a booster, but, that with minor refurbishing, (fuel,
shocks,expendibles, & ect), it can be ready to fly again in a few days.
The shuttle takes about 3 months from landing back to launch pad. Thus
a SSTO can make more trips than can the shuttle. All of this reduces cost.
Also the shuttle will still play a very important role, even with the SSTO
in full operation. the shuttle is a heavy lift vechile compared to a SSTO.
At least for some time to come.

Hi... I'm another Amiga user looking for some software I can use for
packet. I'm currently using the AX.25 protocol, simply because I haven't
taken the time yet to become familiar with TCP/IP.

I have two software items here: AmiCom and AmiPac. Neither work well
for me. AmiCom will not even configure to my TNC (I have a KPC-3). It
retries out without any connection. AmiPac at least runs, but it has a
nasty habit of retransmitting portions of previously sent packets at
random. And I'm not aware of when it does it! (I have to be told by the
receiving station of the events.)

I have reluctantly resolved to using an A2088 bridgeboard, and using
HostMaster II+ software. What I'd REALLY like is someone to re-port
HostMaster to the Amiga!! But in the interim, I'm looking for something
(anything?) that I can run on my Amiga. Any suggestions?? If you need my
system configuration, let me know...

Thanks much!!

3127. New Macintosh Macnet Roster dBase

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-17 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1707950521030001@wd1v.mv.com>
Source record: 42414

Free, Fun, and Easier to Use Than Ever..."Macnet Roster"

"Macnet Roster" (ver. 678) has just been updated and is now a stand-alone application!

You no longer need HyperCard to use this program - but it has virtually all of the features and convenience.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

3128. Free Macintosh TCP/IP + Docs - Latest Version

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-17 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1707950522200001@wd1v.mv.com>
Source record: 42415

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

version NET_Mac2.3.53

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Added hostname to 'ping' output
- Some cosmetic mods for popmail
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
(from Adam PA2AGA (e-mail: adam@iag.tno.nl)

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

Hi. I need a jumpstart to compile my own version of jnos. Could someone point me in the direction of a FAQ somewhere or be so kind as to email me so I could ask a few questions?

For instance, I am stuck on trying to find the .C file that one would use to begin the compile after setting up makefile and config.c.

Thanks...

I will be able to upload shareware files to several BBS's and a couple of the major Net's for free. I do not work for any of these places so flamers go for it. As I will make no monetary gain from this endeavor I will also make no guaranty as to getting your shareware on any certain time or place. PLEASE do NOT send it to me as EMAIL. The best way for me to get a copy is for you to give me the closest FTP site that it has already been loaded to. I will then go get it check for problems and pass it along. One thing I must have is a letter releasing me to put it on these sites. I will not get into the legal problems with this,which many of you already know.

So if anyone wishes to have their product seen by more people let me know.

1. A Letter releasing me to put it on a commercial or non-commercial site. (just a note is enough)

2.Directions to the site to get it. If it is not on a site we can work out another way I will work with you.

3. I do need some way to check who you really are. a call sign a phone number an address both email and real snail mail. any of these will work.

Please send any replys to drayegon@america.com

If you are using borlandc version 3.1 (the de rigueur compiler for JNOS)

First, make a directory for your source code and unzip the JNOS source in
that particular directory, and then hack config.h to your spec.

Edit MAKEFILE Usually you'll just need to set PROCESSOR to your wants
and check that COMPILER = BC3 There's a line :- !elif ($(COMPILER) == BC3)
followed by a PATH statement which should point to the directory
where your compiler lives (in my case I alter from d:\borlandc to c:\borlandc)

Make sure that the MSDOS PATH knows to search the compiler root, and it's
'bin' subdirectory too.

Now for the really tricky bit.

Change directory back to the one where your source is.

Type MAKE or if you have a 386/486: MAKER

And you should be in business !

Cheers,

Gareth.

3135. Help with NOS and gateway

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-17 00:00:00 UTC
From: "R. Bingham" <rbingham@blue.weeg.uiowa.edu>

Source record: 42422

To the group:

Need some help with getting NOS configured to allow forwarding to a local AX.25 BBS. I've done the things that NOSintro says to do...the rewrite file to *@localbbs PBBS_NET and the forward.bbs file. The problem is that my test messages don't wind up in the local file PBBS_NET. They go to the local mailbox for the call sign used in the message header. That is, if the message is addressed to AX0ABC@localbbs, it winds up in my local mail inbox under call AX0ABC rather than in the local mail box under PBBS_NET. I really worked on this but I can't seem to find what is going wrong. It appears that it is not scanning the rewrite file because the address never remaps in the out going mqueue or when it hits the local inbox under whatever call it winds up under. I am running NOS 304. Is there a bug? Or have I missed something? I have worked with the smtp gateway setting and tried several values. I think I can get it to forward through another station who is set as a gateway, but I can't seem to get it to work when I try it. Help...

> performers.

The problem of distorted modulation on the TM733 when trying to do more
than about 2.5 kHz deviation (at the 9600bd data input) is present on
a lot (if not *all*) of these transceivers.

I did extensive measurements on the TM733E(urope) transceiver : the
transmitter showed a peak of about 4 db in the input voltage versus deviation
characteristics at 63 Hz. Enough to cause a lot of bit errors when used
with 9600bd G3RUH modulation.

The turnaround time is about 150 ms. Not suited for 9600bd packet, IMHO.

I've used the HTX-202 and Baybac to together for about 1 year. I've had no problems with it. You need an IBM PC/XT/AT or fully compatible computer with a free serial port on COM1 or COM2. You also need connectors for your radio. All the other mods can be done with a screwdriver and using software. Baybac is great for 1200 baud packet, but don't expect too much more.

I bought the KAM Plus and do with it exactly as you described. It's
a great unit. Consider the XPKAM software.

>
>73,
>
>N9AVG
>
Well, that's not the whole story. The KPC-3 needs to be upgraded to
6.0 if you desire to put it in what we call a "stand alone tracker".
The tracker is a GPS-TNC-Radio unit in a single enclosure...usually
mounted on an object of interest to track. The TNC needs to be able to
manipulate the GPS data in this case...and would require V6.0.

For use with a PC, however, the APRS program will get the data from the
GPS, manipulate it, and send it to the TNC...upgrade not required.

Hope this clears it up a little more...

>Allan N3TCM

Allan,
How much is the BAYPAC? It's great for those just getting started
and also for those developing applications...but if you get bit by the
packet bug, you'll be ready to toss it in only a few short weeks.
Consider the cost of the BAYPAC as compared to the ever-popular
Kantronics KPC-3. At $109 (going price at the big 1-800 retailers) the
KPC-3 will not disappoint you.

Just my two cents.

As the STS65 QSL manager, I was able to look at many printouts from packet contacts as proof of connecting to the shuttle. I noticed that some were able to have printed out the date and time as part of the line header. Does Baycom (I'm using ver. 1.4) have the same capability? It appears not.

Thanks in advance.

Message-ID: <3uh5pl$apn@romulus.ucs.uoknor.edu>
Source record: 42344

Can anyone give me advice on purchasing the Hal ST-8000 modem??? I have the Hal 4000/m board and a Kan+, both of which I run as DOS programs in windows. How much better is the ST-8000??? What software programs do you use?

Incidently, the Hal 4000/m was much better on rtty rx than the Kam+, until I used the new Timewave DSP-59+, ver 3.0, which can DSP remodulate the rtty signal. With that the Kam+ at least equalls the 4000/m board, in my opinion. Anyone else do this???

Please reply directly.

I can't even get it to talk to my packet network over ethernet, might be doing something wrong. Jnos runs fine under W95 but the multitasking leaves a bunch to be desired (W95's not Jnos') so I do most of my work under OS/2.

If you want to get into TCP/IP packet radio, find someone who has set it up in your area & pick their brain, I suggest using Jnos until you understand the radio network & then you should be able to get W95 to work. The IP stuff looks quite capable of being used that way although routing sounds like it will be a pain.

Good luck, 73

[Major deletion]
> the
>KPC-3 will not disappoint you.

The KPC3 is overall an excellent unit, however some of them may disappoint you until you go in and modify the receiver so the 3105 bias can be adjusted, and adjust it for optimum reception. We have had two that received very poorly until this was done. Hopefully the next revision will include this vital feature.

In regards to the question KPC3 vs Baycom, it depends on what kind of operation you want to do. If there is a reliable BBS in single-hop range, using a Baycom to check into this BBS will eliminate the need to keep your computer running all the time so others can leave messages.

Baycom advantages:
* Multiple connects and simultaneous monitoring (requires additional cost (?) host-mode software with KPCx).
* Lowest cost ($15 for homemade modem, approx $49 for commercial one).

KPC3 advantages:
* Can receive mail without PC program running.
* Can operate packet under Windows, or with non-PC terminal.
* Better for BBS server or non-AX.25 protocols.
* Can be used as a standalone "node".

So there you have it. If you're *really* bitten by the packet bug, you won't want either one, you'd be doing 9600 baud or more.

APRS will not work in KISS mode. APRS simply acts like the operator,
changing TNC-2 parameters at the command prompt. The user is simply an
application layer away from the command prompt...

WB4APR has been considering puting out a BayComm version - put I think
it's LOW on the priority list.

Back when I couldn't afford a real TNC I used to wonder if all those old
9600 baud modems that show up in piles at the surplus places would be useful.
As far as I know (still don't know for sure), those modems are for dedicated
lines between mainframes and stuff. I have no idea if they do any kind
of negotiating at all, or what the bandwidth is, or even if they use FSK,
or if the voltages used are typical phone-line compatible, or if they are
passive or active (I mean, can you just hook up wires between them and
start talking, or does there have to be a power supply inline?), all I know
is they are abundant and cheap. Any ideas?

In Germany we are running our backbone network on 1.2GHz and 5.6GHz using modified G3RUH type modems (simply scale down the capacitors in the analog filters) or even a scalable modem (published last year at the networking conference). We are using single channel radios with direct frequency modulation of the cristal. On 23cm the maximum achievable baudrate is 19k2 (due to the channel spacing of 50kHz) and on 5.6GHz 115k2 (because the RMNC system can't go faster currently).

All this is quite cheap. The troughput is very good as the RMNC system has a very good auto router (not comparable with the old NETROM thing).

So all you need is a radio that can be modulated in FM (on 70cm an old rig with quartz should be ok) and a G3RUH type modem (or eqiv. like DF9IC or RMNC3 from DK7WJ). For 19k2 you have to change the IF filters to 50kHz.

The main advantage of the 56kB modem is the reduced RF bandwidth occupied, but a linear transverter with a linear PA is needed.

Hi,
Someone knows how to measure the deviation of the carrier in an FM transceiver in an easy way (No: "Buy an spectrum analyser" responses please). I need this measure to adjust one 9600 baud modem to the optimum excursion of +- 3KHz.

Thanks for responses & 73

Here's the procedure I've used:
You need a receiver tuned to the frequency you want to use,
another transmitter like a HT, and a DC coupled oscilloscope.
None of this equipment needs to be very high quality. A scanner
will work as a receiver, an old 5 MHz scope is OK. It does help
to know the HT transmits exactly on frequency, as you can then
match the frequency of your data transmitter to it as well.
Otherwise you'll have to set it by other means.

First, connect the scope to the discriminator of the test
receiver. Set the scope for DC coupling and about 100
us/division. Then calibrate the setup by using the tuneable
transmitter in the HT. Use low power into a dummy load so there
isn't a lot of stray RF around. The DC level out of the
discriminator should be nearly directly proportional to the
frequency. So, transmitting on frequency, you will see a flat
line near the center of the screen. At 5 KHz higher, the line
will move to the top or bottom, and 5 KHz lower it will move the
other way. Adjust the vertical gain and position so you have a
known number of KHz per division. If there are 10 vertical
divisions, then 1KHz per division makes sense, then you can see
+-5 KHz.

Now key the data transmitter under test, and observe the pattern
on the scope, which is a display of instantaneous frequency
(assuming the filters in the receiver are wideband enough). If you
set up for 1 KHz per division, making the pattern 6 divisions high
means that the deviation is +- 3 KHz. Also any error in frequency
will also be apparent as the pattern will not be centered. After
measuring and adjusting, it's a good idea to re-check the receiver
/scope calibration to be sure nothing drifted.

A commercial "deviation meter" works on the same principle, it measures the p-p discriminator voltage automatically. But it doesn't show you other things about the quality of the signal that the oscilloscope will.

Watch the output of the discriminator with a DC coupled scope.
Do a carrier only test of On Frequency and +/- 5KHz. Note the peak voltage
excursions.

Now listen to the TX signal with the receiver and set the peaks to equal
60% of the 5KHz peaks.

Have fun.

(Alternative method requiring a few extra goodies:)
TAPR sells a deviation meter kit. Digital display for around
$100. VERY clever design and works quite well. All you need
is a scanner or other receiver to connect it to. 0.1 to 9.9
KHz deviation range. Uses (typically) 10.7 and 455 KHz IF's.

kurpiers@hades.uet.e-technik.th-darmstadt.de (Alexander Kurpiers) writes:
>The main advantage of the 56kB modem is the reduced RF bandwidth occupied,
>but a linear transverter with a linear PA is needed.

Well, sort of linear, the amplitude variation is only 3 dB. You can
use a Class C amp, but the spectrum broadens considerably.

I don't think that the main, or only, advantage of the 56 kb RF modem is
reduced RF bandwidth. Certainly MSK does require modest bandwidth, but
the modem has other features, such as a tracking data detector that allows
good performance even with non-optimum signals, and the ability to operate
full duplex. It's a pretty robust design. And it can be rather easily
modified to operate at 128 kb for even higher throughput.

BTW a commercial prototype of the WA4DSY RF modem was shown in the
PacComm booth of the Atlanta Hamfest this past weekend. It looked
very nice. It's been reduced to a single board and optimized for
manufacture. It has a signal strength indicator, status LEDs, and
other nice touches such as a single 12 volt power requirement.

Rumor has it that an integrated transverter may be offered for the
popular 56 kb bands in the future. GRAPES kits will continue to be
available of course. I don't know yet if future GRAPES kits will be
based on the current flexible 3 board design or on the new single
board design, or perhaps your choice. More info as I find out about
that.

When this commercially built version of the modem hits the streets,
I expect there will be an upsurge of 56 kb activity by those who
were daunted by the need to assemble a kit. No price information
is available at this time. Nor do I know the expected release date.
However, if you don't mind wielding a soldering iron, go ahead and
get the current GRAPES kit. You can hang as many LEDS off of it as
you wish. There's no reason to poke along at 1200 baud or struggle
to get a voice radio to work at 9600 baud anymore.

As a second BTW, PacComm was also showing the PACTOR II controller
at the show. This looks very attractive for HF operators. Sadly,
HAL wasn't in attendance. I wanted to check out their new P-38
Clover, PACTOR, AMTOR, and RTTY card. QST gives it an enthusiastic
review. Things are looking up on both ends of the digital spectrum.

>excursion of +- 3KHz.

If you have a very selective receiver and a variable tone generator,
you can use the Bessel null method to find the level needed for 3 kHz
deviation, then use a scope to match the modem output level to that
tone level.

A crude, but servicable method you can try, if there is another rig
that is already properly adjusted which you can use as a reference,
is to hang an AC voltmeter off of a receiver, a scanner will do, and
adjust the volume control of the receiver for a convienent reading on
the meter with the known good TNC/radio combo. Then just transmit
with the TNC/radio combo you want to set and adjust it for the same
reading on the meter with the modem level control.

But really, you don't care exactly what the deviation is as long
as it works properly. So if you have a pair of rigs and TNCs, just
transmit with one while watching the eye pattern on the other and
adjust deviation just below where the eye starts to compress. Do
the same for the other rig, and you'll have set them for best
mutual performance, whatever deviation that winds up being.

If you don't have a scope, remember that the scramblers in the
modems give you a built in BERT capability. Just feed the transmitting
modem a constant '1' and hang a counter on the output of the receiving
modem to count the '0's it receives. Adjust deviation for the fewest
counts and you'll have set for the best BERT, which is what you really
want to achieve anyway.

I did have a same problem in my shack with 386DX 25Mhz. I modify the
computer box by myself.

(1) All cable must be shielded by cooking foil and must be conntected
to the computer box.

(2) All cable from PC and to PC must has toridal core. I got one from
local Radio Shack store.

(3) I painted the plastic rear panel with conductive paint.

(5) Also the monitor display is the noise source, treat same as PC.

I hope this will help you.

sure. setup an ethernet and have NOS or Linux as a TCP/IP router.
Update Win95's routing and there you go.

>I am looking to gett into packet TCP/IP , and am wondering if Win95
>wil make configuring it any easier.

Win95 makes the TCP/IP easy for ethernet and SLIP/PPP dialup connections.
Setting up NOS as a router is probably still the hard part.

And if your doing 1200 bps packet, I'd ask "what's the point?",
because most TCP/IP services will be too painful to use at low speeds.

But Win95 works pretty good on our radio club's ethernet LAN, connected
to a Linux router to the 56kbps network.

Hi Dave,

Well I finally got PMNOS going. So now (right now) I am connected to Internet via PPP useing the Alternate Dialer that comes with Warp and my TNC is running connected to an external modem at 4800 baud and monitoring 2 meters.

I could not get it to go before, I have left messages in various newgroups asking if anyone had had any success useing any native OS/2 NOS s/ware, I got no replies so I hacked away at PMNOS. A cuple of things, I could not get it to work on COM2 so I had to swap Internet to that and NOS to COM1. Changeing the comm port paramaters in the ATTACH command in the autoexec.nos did not appear to work .. it still only talked to comm1. I had to # out the trace statement also in the autoexec.nos file, with it in the program would not start up correctly.

With the above changes all now is working well. So now I can use TCPIP on Radio at the same time as checking newsgroups on Internet etc.

Hope this is of help.

One of two things would need to happen:

1) A TNC that in KISS mode actually took a SLIP frame and AX.25
encapsulated it.

or

2) A NDIS driver that did KISS framing to a standard TNC in KISS mode.
(And probobly an AX.25 stack for non-TCP'ers to do things.

I don't know about any ftp sites, but there is a high-speed mailing
list where you might get some answers. The Gunnplexer system is
in the ARRL Handbook, and in their new book, Packet: Speed and More
Speed.

Well, that's about 50% of new; so as long as it's in working order, I don't think you're going to get hurt in the deal... All you'll need is a serial cable, terminal software, and a radio interface cable. (The pin-outs are listed in the manual, and you can get a DB-9 male at any Radio shack.)

I run one on my packet station, and love it!!

Hi Tim, I TCP/IP from Anne Arundel County and broadcast on 145.690 for
all my
packet work. You will find the A.A.Co. Gateway there at 44.60.224.1 as
operator
wa3uev. For regular AX.25 you will find ka3rfe at ANNAP or the PBBS at
ANNBBS.
I assume you are looking for 1200 baud links, I am not aware of any 9600
links,
at least not yet.
Good luck, send me e-mail if you have other questions.

3190. KISS software bug ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-20 00:00:00 UTC
From: dao@mrspock.mt.att.com
Message-ID: <DC12Kw.4p2@nntpa.cb.att.com>
Source record: 42374
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Has anyone else observed the following problem when using the MFJ TNC
in KISS mode?

I have two 1270c TNCs, one is about 1 1/2 years old, the other is
brand new. I have observed that both of them will go through a
restart cycle (3 blinking lights) after a period of about 3 minutes
of no input/output activity.

I confirmed this by placing the units in KISS mode, then disconnecting
the radio and stopping the terminal program, ie the units just
sat there idle in KISS mode. I get the same results, regardless
whether the terminal is running NOS, or a terminal emulator,
or just sitting at the DOS prompt, or even physically disconnected.

I reported this to MFJ tech support and they said "oh yeah, we
saw that problem about a year ago and have new eproms with a fix".
So they sent me new eproms, and guess what? No difference.
I guess the fix doesn't work.

Actually the restarts don't usually cause a problem, since the unit
comes back up in about 2 seconds, reloading the parameters it had
stored in battery-backed RAM. However, a couple of times I noticed
that if NOS was sending some data to the tnc at the same time it was
in the restart cycle, strange things might happen - like a total
lockup requiring recovery with a power off/on sequence and a
loss of b-b RAM data. This could be a problem at a remote site !!

So, has anyone else seen this? Is there some parameter or set up code
needed that they forget to tell you about? Was the software designed
to require activity on the comm port? Except for this bug, the
units seem to work very well in KISS mode the rest of the time.

Thanks.

I'm trying to determine which TNC to purchase: the Kantronics KAM+ or the MFJ-1278B. I like to MFJ because of the Color SSTV support, and I like the KAM+ becuase its dual port.

My interest is mostly digital sat work, downloading telemetry info and pictures.

Any recomendations/opinions/experience with either is appreciated.

Thanks,
Kory

FWIW, you can take a Garmin 45 (around $285) and add the data cable
and interface it with a laptop via the serial port. The data stuff is
around $45. I use a laptop with a portable CDROM running deLorme's
Map Expert which contains every road in the US. Works slick! You see
your position on the map as a dot and can leave "bread crumbs" to mark
your route.

I don't know that GTOR, PACTOR or PACTOR-2 stand for exactly, but I know
that they are digital protocols (similar to packet) that are used for
slow speed, HF communications. HF is noisier and suffers from signal fading.
Standard packet doesn't handle this very well. GTOR, PACTOR, and CLOVER are
supposed to handle HF bettern than standard packet radio.

>What do GTOR and PacTOR stand for, and what do they do/are they/etc.
>PLEASE TAKE a second and respond!!

Try the following:

G-TOR - Golay Transmission over Radio

An amateur system developed by the engineers at Kantronics, Inc. G-tors
main advantage is speed - up to 4 times faster then pactor. It also
incorporates a data-interleaving system that assists in minimizing the
effects of atmospheric noise and has the ability to fix garbled data. G-tor
tries to perform all transmissions at 300 bd but drops to 200 bd if
difficulties are encountered and finally to 100 bd. All acknowledgments
(ACK's and NAK's) are sent at 100 bd.

PACTOR - Packet Radio/AMTOR

A Pactor Level II signal features 2 tones w/200Hz shift using baud rates
of 100 or 200 fitting into a 500Hz channel. Depending on band conditions
the data throughput can be increased by changing the modulation form used:
bad conditions start with BPSK (2-PSK) w/QRG diversity, then D-BPSK without
diversity, then D-QPSK (4-PSK) and finally D-QPSK at 200 baud. This puts the
maximum throughput at 800 bits/sec.

CLOVER - named after its modulation scheme(s) when viewed on an O-scope

A system developed by Radio Amateurs. Clovers key characteristics are
band-width effeciency with high error-corrected data rates. Clover adapts
to conditions by constantly monitoring the received signal. Parameters
which can affect quality and reliability of the transmission such as
block data errors, phase dispersion, frequency offset, and signal to noise
ration are monitored. Based on this monitoring, Clover determines the best
modulation scheme to use. Clover supports the following formats:

format baud rate
------ ---------
BPSM 4 pulse binary phase 125 baud
QPSM 4 pulse quad phase 250 baud
8PSM 4 pulse 8 phase 375 baud
16PSM 4 pulse 16 phase 375 baud
8P2A 4 pulse 8 phase 2 amplitude 500 baud
16P2A 4 pulse 16 phase 2 amplitude 500 baud

Total band width for all modes is a narrow 500 Hz.

>What do GTOR and PacTOR stand for, and what do they do/are they/etc.
>PLEASE TAKE a second and respond!!

TOR is Teleprinting Over Radio. There are several TORs in commercial, military, and amateur use. AMTOR is another amateur TOR, the AM standing for AMateur. It is based on SITOR, a commercial maritime protocol. TORs differ from RATT, or RTTY as amateurs call it, by using some form of positive acknowledgement, IE an ARQ protocol (Automatic Repeat reQuest), and/or some form of Forward Error Correction, or FEC, to insure that the message is received correctly.

AMTOR uses the 5 bit Baudot (or more properly Murray) alphabet, and thus can't handle lower case, embedded into a 7 bit string. The additional bits are added so that there are always four mark and three space bits for every character. It sends 3 characters, then waits for an acknowledgement before continuing. If it doesn't get a satisfactory acknowledgement, it resends the 3 characters until it does, or until some specified timeout value is reached. Errors requiring resends are detected by determining that the mark space ratio isn't 4/3 for a given transmission. This is called mode A, for ARQ. This method is fairly error tolerant, but the 4/3 error detection is somewhat weak.

FEC mode works differently. The characters are divided into groups of 5, and each group of 5 is sent twice. No listening for acknowledgements is done. The receiving end uses the first character group if it is unmangled, or uses letters from the second group to replace letters mangled in the first group. If the same letter in both groups is mangled, then the receiving station prints a space. This redundancy and time domain separation offers an immunity to burst errors, but doesn't guarantee totally error free reception. Because it doesn't stop and wait, FEC is normally much faster than mode A, but at the cost of the possibility of more uncorrected transmission errors. (There are *much* more powerful FEC techniques than this simplistic method.)

PACTOR can be considered a marriage of packet and TOR. It uses the strong CRC error checking of packet, along with the ability to handle arbitrary 8 bit octets of data, but it limits transmission lengths before waiting for an ARQ acknowledgement to 96 bits at 100 baud or 192 bits at 200 baud, and doesn't need the high overhead of an AX25 packet. These short, data rich blocks mean that errors and resends are less costly. A method called Memory ARQ, which isn't ARQ at all but rather a FEC method, is available. If a block is received that fails CRC, it is preserved in memory and compared to the resend

of that block if that second block also fails CRC. Then, somewhat similarly to the AMTOR FEC mode, bits of the two blocks are matched in memory through a heuristic that attempts to make one block capable of passing CRC out of both corrupted blocks. This can cut down on the number of resends needed in a pure ARQ system considerably. Message transmissions are always (nearly) error free, like packet, and unlike AMTOR FEC mode. The CRC can be fooled, but it requires a very unlikely combination of errors to do so.

Packet, of course, uses the familiar AX25 protocol. Due to the relatively high overhead of the AX25 header, and due to the fact that most errors on HF are burst errors, resends tend to take a long time, and the longer blocks are more likely to be corrupted by a noise burst, so performance on HF circuits is mediocre at best. No FEC is typically employed with packet.

GTOR is a Kantronics proprietary TOR protocol. I'm not sure that the G stands for anything. It is similar to PACTOR, but won't interoperate with it. Performance is said to be a bit better than PACTOR. However there is now PACTOR II, which is reputed to be considerably better than GTOR. And there is also Clover, a protocol proprietory to HAL. It too is a TOR, though its name isn't an acronym, rather it is descriptive of the constellation generated. It uses a four phase modulation that resembles a four leaf clover. It uses several robust techniques to maximize throughput on the channel while maintaining error free message delivery. It's probably the best system available for purchase by amateurs at this time for use on noisy HF channels.

Note: none of these systems address the radio hardware, which is typically a SSB voice radio pressed into data service. There are *much* more powerful techniques available to the builder and protocol coder than any of these methods. A system purpose designed from the ground up will almost always be far superior to methods attempting to work through analog channels intended for voice.

So called matched filter methods, coherent modulations, and very strong FEC codes, such as Golay, can push the system close to the Shannon limit. Voyager used some of these techniques to approach the Shannon limit while communicating from the edge of the solar system. No manual method, such as OOK Morse, can even approach a tiny fraction of the Shannon limit on a noisy weak signal channel. OOK encoding typically suffers at least a 32 dB deficit when compared to the methods used for Voyager. Voyager's designs are at least 20 years old, and are no longer high tech or very challenging for the amateur to duplicate or exceed.

32 dB represents more than a 1000:1 power difference, so proper designs and codings can get through with 1/1000th the transmitting power as manual OOK encodings such as Morse. Think about doing EME with one watt for a moment to get an idea of what widespread amateur use of these techniques could mean.

>Allan N3TCM

It's a great setup, and the price is right. I got a Baycom modem for $30
from the local packet club and used it with an HTX-202. You have to
combine the audio out and PTT lines with a .1 ufd capacitor, and it seems
as though there was a 2K ohm series resistor in there, too. This needs to
be done with any HT, but the HTX-202 needed a different resistor value than
other HT's. Hook up with other packet enthusiasts in your area. Don't be
shy; they started out knowing nothing, too.

An external antenna is a 'must have' item. You need to be heard by others
to prevent collisions. A homemade 1/4 wave vertical with ground plane
will work just fine.

3209. Monitoring G-tor QSOs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-21 00:00:00 UTC
From: stan@mutadv.com
Message-ID: <3uolif$99b@news-2a.csn.net>
Source record: 42246

There have been any number of posts over the past few months about the relative merits of Pactor vs G-tor. One consistent complaint has been that G-tor provides no means (no PRACTICAL means) of monitoring QSOs. Such a capability is a feature of every other amateur mode except G-tor and Clover.

Well, it's time to recheck the scorecard again. Kantronics has released their version 8.0 firmware for the Kam with... you guessed it... GMON mode. GMON, or G-tor monitor mode, monitor G-tor transmissions. And, the new KaWin 6.0, host-mode software for Windows and all Kantronics TNCs, supports and extends the capabilities of Kam 8.0 and G-tor monitor mode.

Download the full KaWin 6.0 program from the KaWin Home Page or FTP Site today.

KaWin Home Page: http://www.mutadv.com/kawin/

Source record: 42247

In article <3uo4dr$cms@news.isl.net> gbaron@sparc.isl.net (Gilbert Baron) writes:
>AX25 on HF is a TOTAL waste of spectrum space TOTAL.
>IT SHOULD BE OUTLAWED! at least IMHO or not so HO.

Overreaction alert. While AX25 has more overhead in its frames
than we'd like for slow HF channels, the protocol isn't hopeless
for HF. The *modems* used are hopeless, however. A dumb Bell 103
modem with no channel adaptive characteristics operating through a
voice grade radio is a *horrible* kludge. A good layer 1 RF modem
with robust characteristics for the HF channel would go far toward
making AX25 palatable on HF.

Don't go confusing layer 2 with layer 1. PACTOR and Clover perform
better because of better layer 1 methods, and not because their
layer 2 protocols are that much better (though they are that too
for non-contending point to point links). There are good reasons
to want to use the AX25 protocol on HF, to allow digipeating, or
for compatibility with VHF networks being linked on HF, or to allow
more than one pair of stations to share a frequency at the same time,
are three good reasons. But they'll remain lost causes as long as we
stick with the inferior modem technology shipped in today's TNCs.

You are of course correct Gary. I will stick with my recommendation to
save your money since no reasonable modem is yet available. Multiple
users on the same channel just slows you down even more although it
helps the overall. Your analysis is true as is your statement that the
available hardware is hopeless.

We don't need HF AX.25 packet to link into the VHF packet system..
Aplink works just fine for HF to VHF message forwarding.. As the HF
propagation inproves, the REAL digital wars will start, with everyone
fighting for spectrum.. Then the wider bandwidth of 300 baud packet
will really hurt the packet users.. The rest of us using 400 or 500 Hz IF
filters, and using the more spectrum efficient modes, will be able so
slide up to a packet signal, and still get through, but packet users will
hear QRM from our signals..

Packet as it's being used today is a waste!

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

> Packet as it's being used today is a waste!

Aplink is Ok for Email forwarding, but not for live interlinking, or
operating on a contending channel. AX25 does offer some capabilities
we don't get with other protocols. However, you're absolutely spot on
that the modems in use for HF packet are bandwidth inefficient and not
robust at all in the face of interference. That could change.

With the automatic digital segments on HF so small, we're going to
have to adopt protocols that work on a contending channel as activity
picks up. AMTOR, PACTOR, GTOR, and Clover aren't designed to work in
a contention environment. Packet is. What we need to do is to adopt
more robust modems for packet, and perhaps modify AX25 for lower overhead.
We *can* use error correcting modems with AX25, we just aren't doing it.
Error correction can be partitioned into the level 2 protocol as suggested
by Karn, or we can do it at level 1 strictly in hardware. This is the
simplest way given the regulatory environment.

Bell 103 and AX25 are *not* wedded to one another, except for current
appliance operators. For them only, I'd agree that they'd best abandon
HF packet and stick to AMTOR, GTOR, PACTOR, or Clover for their HF
digital operations. The rest of us are going to *have* to find a way
to make packet work on HF. We *need* the ability to share a channel
too badly to turn our backs on packet.

The Central Valley TCP/IP net is growing in size.

Someone needs to write a Windows version of NOS that is user friendly. I understand someone is writing a WIN95 version, but I feel that isn't good enough.

NOS itself is a pain if you arn't that computer literate.

Steve Orman from Fresno California

Source record: 42272

Hi Folks, I was wondering if anyone has been successful in running NOS
under NT. It works great under WIN95, but it has problems addressing
the com ports under NT. I can see the TNC accepting the outbound
packets, but the data coming back from the TNC get ignored. I looked
and the port setting under control panel and they show 9600,8,n,1.
When I open a DOS box and look at the com ports with mode, they show
being set at 1200,5,n,1... YES ... 1200,5,n,1... It really has me
mystified how the heck it came up with 5 data bits.
Any suggetions will be accepted with great pleasure, I have been
trying for a couple of months to make NOS work under NT. I am about
ready to move NOS to separate P.C. and port it with a LAN card.
Thanks in advance... Mark

It's a protocol issue. AMTOR, PACTOR, and GTOR do not tag their
transmission bursts with an identifying header, so the receiving
station has no way to differentiate bursts directed at it from
bursts directed at other stations. They also do not attempt to
hold off on carrier detect, and will merrily transmit on top of
another signal.

>Can any of the controller units be put into a binary mode where you could
>send KISS/SLIP packets, with/without the aid of a framing shim? It would seem
>like a reasonable thing to support.

Sure, you could do that, but the channel still has to be non-contending.

If you "slide up to a packet signal" knowing that you will cause QRM
to that packet operator, you are guilty of intentional interference.

Of course, that never bothered the APLINK lids with their band scanning
forwarding networks before unattended operation became legal. They
just fired up wherever the computer decided ... without bothering to check
(they don't have the hardware) to see if the frequency was in use.

: Has anyone else observed the following problem when using the MFJ TNC
: in KISS mode?

I have noticed the same thing on my MFJ 1270b which is about two years old, but I do not think it is a problem.

: Actually the restarts don't usually cause a problem, since the unit
: comes back up in about 2 seconds, reloading the parameters it had
: stored in battery-backed RAM. However, a couple of times I noticed
: that if NOS was sending some data to the tnc at the same time it was
: in the restart cycle, strange things might happen - like a total
: lockup requiring recovery with a power off/on sequence and a
: loss of b-b RAM data. This could be a problem at a remote site !!

You are right they do not cause a problem. There is also not much that it has to load out of RAM. All it loads is the fact that kiss is on. KISS is a very small program compared to the normal command interpreter that the tnc loads. All of the work of putting out data and handling incoming data is mostly handled by your computer. KISS meens (Keep It Simple Stupid). When your TNC is in KISS mode it is basicly a stupid box waiting for data to go through.

This also would not cause a problem for NOS because it checks flow control before sending data.

Here is another question for you. Does your TNC generate interferience on 2m close 146.940? Mine make so much noise that it almost blocks out our local repeater on all the radios in my shack?

I'd be happy if there was just a shim or such to set up a SLIP connection to
another machine (which will be connected to the TNC); there seems to
be no way yet to set this up in Win95; (I have my modem on COM3 and my
SLIP will be on COM4, which will go to my DECMate to be routed, assuming
I can get software up on the latter).

Your "sideband switching" scheme is really just frequency shift keying. There are MUCH easier ways to do this. In fact, for your application I might suggest using an audio frequency shift keyed subcarrier transmitted using FM modulation on a low power VHF or UHF carrier. But you'll probably need full duplex so you need two independent transmit/receive channels on different frequencies. Are you sure you want to do this? The best way would be to use off-the-shelf local area network hardware and software and WIRE transmission.

Good luck,

Lee, WA8YBT/6

3254. Telnet address for ham irc?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-23 00:00:00 UTC
From: axinar@one.net
Message-ID: <3uu3k5$ion@mail.one.net>
Source record: 42291

Would someone PLEASE remind me to write this down once I get it??? <<Grin>>

There are several packet BBS's around the country (and in Canada and Australia as I recall) that are running TCP/IP that are connected to each other via the Internet. They also have the ability to be connected to from other places on the Internet via telnet connection.

I think one of these places is in Colorado and another is in Toronto.

About 4 years ago or so I remember having telnetted to one of these boards and getting onto something that looked alot like the IRC ... only most of the people in this IRC were connecting from 2m.

Does anyone know what the telnet address are for these PBBS's?

Thanks!

John KB8GYS

3255. Re: What is GTOR/PacTOR

gary@ke4zv.atl.ga.us (Gary Coffman) wrote:

>So called matched filter methods, coherent modulations, and very strong
>FEC codes, such as Golay, can push the system close to the Shannon limit.

The Golay code is not particularly strong, although it is relatively easy to implement. Golay suffers from a drawback common to all block codes: it's difficult to make use of soft-decision information. This results in an inherent 2dB loss compared to soft-decision decoding.

>Voyager used some of these techniques to approach the Shannon limit while
>communicating from the edge of the solar system.

Voyager uses two codes in combination: a rate 1/2 K=7 Viterbi decoded convolutional code, and a (255,223) Reed-Solomon block code with 8-bit symbols. The convolutional code is directly above the modem, where it can make use of soft-decision information. The Reed-Solomon code runs on top of the convolutional code where it can correct (some) of the errors remaining after Viterbi decoding. Interleaving between the codes spreads out the Viterbi error bursts to different RS blocks.

The combined Eb/N0 bit error rate curve is an impressively steep, almost vertical line at around 2.5 dB. Uncoded PSK requires 10 dB to achieve a 10^-5 BER; ideal noncoherent FSK is about 3dB worse, and real amateur modems like 1200baud AFSK/FM are in the 20s.

The concatenated Voyager scheme is taken quite a bit further in Galileo. The convolutional code rate is lowered to 1/4, and the constraint length K increased to 14 -- extremely high for Viterbi decoding. The RS code blocks use different amounts of parity to enable an iterative decoding process: errors corrected by the RS code are fed back to the Viterbi decoder, which corrects a few more bits, which helps the RS code, and so on. The resulting Eb/N0 requirement is an extremely impressive 0.56dB.

>No manual method, such
>as OOK Morse, can even approach a tiny fraction of the Shannon limit on a

>are at least 20 years old, and are no longer high tech or very challenging
>for the amateur to duplicate or exceed.

Very true. See my web demonstration of CW vs coded PSK:

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:
: It's a protocol issue. AMTOR, PACTOR, and GTOR do not tag their
: transmission bursts with an identifying header, so the receiving
: station has no way to differentiate bursts directed at it from

But still presuming that the boxes can be put into an FEC mode, and
you can fill the transmission bursts (frames/packets whatever) with
something (AX25 call/IP address) to identify the destination
of the burst, you are over this problem? Monitored packets would be
passed back to the computer for something else to decide to keep or
drop them. e.g. stick a destination callsign in front of a checksummed
PPP packet with a VJ TCP/IP frame or normal AX25 packet inside.

: bursts directed at other stations. They also do not attempt to
: hold off on carrier detect, and will merrily transmit on top of
: another signal.

This seems harder if you want to do CSMA - but do you get very much
from CSMA on HF? OK you probably would done properly and tt would obviously
be a nice thing to have in the hardware/firmware (and shouldn't be much to
ask for in a multi mode box that can do packet), but even on a VHF net
where everyone can hear each other very well, I don't see a huge
disimprovement switching a TNC out of 1/2 duplex to full duplex mode
(param ax0 `whatever' from NOS).

But are there protocol timing requirements that would complicate this?
Like clocking in AMTOR?

: Sure, you could do that, but the channel still has to be non-contending.

Is there anything on line describing GTOR anywhere?

Paul

: with it. Performance is said to be a bit better than PACTOR. However
^^^
The Spring 95 PSR from Tapr has an interesting article comparing Pactor
and GTOR.

Extract from the summary at the start of the article by w2pat:

"... with good signals, G-tor is about 70% percent faster than Pactor.
With weaker signals, however, G-tor data speed falls at a faster rate
than Pactor and it appears that with very poor signals, both have almost
similar speeds."

The test ran for 4 months moving about 3.5MB of ASCII between New Jersey and
Florida.

Hi

As there have been questions (and even one thread that was starting to
get a bit hot) on using Linux in ham radio, I decided to inform you all
about Linux for Hams (it might've been announced here before, but the
situation seems like some poeple could use the info). This is a coming
Linux-installation that has all the software and support a ham could
need - ax.25, PI-card support (let's see when Win95 has those ;), TCP/IP,
the works... You can check out the URL
http://www.rahul.net/perens/LinuxForHams/ for more info. You can also
reach Linux's HAM-HOWTO from there, it shows pretty much everything a ham
need to know about Linux (not the spesifics, just what software there is
and stuff like that). And no, I'm not in any way related to the projcet,
just thought you should know.

The company I will soon work for has a T1 line into
the net and a small network. They have given me permission
to set up a packet gateway for local hams. The catch is...
I have to figure out how to set it up! I have a 386 computer,
4 megs ram, 120meg hd, a network card, and a kpc3 tnc to work
with already. What software should I run, linux, dos, jnos???
Please give me any help you can, I would like to turn this into
something nice, that the hams will use.
Thank you.

Hello all
I have a Yeasu ft-5100 and a mfj1270 W 9600baud modem. Its
recives fine, but i cant connect to anything. It could be that
im far away from all the other 9600, or it could be the radio.
Yeasu claims the radio's data port is optimized for 9600, and
the recive shows it. The transmit on the other hand is ????
Is there anyone out there using a FT-5100 at 9600 baud, and
could they share their experience with this radio, IE. getting
it to work, works well, etc.
Dexter

Also, has anyone gotten a FT-2400 to work at 9600?

3266. Looking for Info on the PK-232MBX

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-23 00:00:00 UTC
From: folsom@halcyon.com
Message-ID: <folsom-2307952001310001@192.0.2.1>
Source record: 42303

I'm trying out a PK-232MBX that a friend of mine might be interested in selling. It has no manuals and I know only the basics about digital transmission/reception, so if anyone could answer any of the following, I'd be grateful.

1. The firmware tag date is March 5, 1993. Is this a fairly recent rev? If not, is it easily upgradable?

2. What is a fair used price for the unit?

3. Does anyone sell the original manual(s) for these units?

4. I've been hacking around with the thing. I've connected it by RS-232 cable to the serial port of my computer. And I've attached the audio cable to the mini-jacks on both the unit and my IC-735. Using KERMIT, I've managed to use HELP to see the PK's command set. So far, so good. But now, how do I get the thing to interpret a digital signal? I've tuned up a few likely CW signals and set the PK to various command states, but none of the text output I've gotten has looked like much more than random ASCII characters. I was hoping that the PK would auto-sense the source and start giving me some readable output. Am I over-looking some basic set-up step here?

5. I've heard there is a Mac terminal package for the PK. Is it a significant advance over just using vanilla terminal software?

6. The unit, as I received it, had only one cable, which is the one with a mini-jack on each end that I am assuming is for getting audio between radio and PK. Are there any other cables missing that come standard with the rig?

Once again, I'd be grateful for any responses. Direct e-mail or News postings will both work for me. Thanks much in advance!

Keith

I think it may mean Gaussian Minimum Shift Keying. This is also the baseband filtering used for the European Digital mobile phone network. It uses BT=0.3 which means that each bit is "smeared" over approxemately 3 bits to minimize adjacent channel interference.

According to MFJ, you can disable this reset by sending PARAM 253 to the
tnc, I use it in my 12070c and it cured the problem. Not all NOS's can send
PARAM 253 to the tnc, you may have to edit and recompile the code, don't
remember where in the code.

3269. JNOS and ethernet + RF ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-07-24 00:00:00 UTC
From: marka@mistral.co.uk
Message-ID: <3uure0$7l@news.mistral.co.uk>
Source record: 42306

Hi all,

I am running up JNOS v110x and have got the the RF side of things working on my USCC 99.9% O.K. just a few final tweeks/scripts to do.

However, I also have attached a packet driver for the Ne200 clone, and is not as quite as it seems. (works fine if I use it under NDIS/WFW). so the hardware is proven good.

If I trace the ethernet port, I can see data zooming past, and if I start a telenet session from windows for Workgroups withh added tcp/ip addon The NOS starts a session, but does not seem to respond back down the ethernet. Consequently the WFW session times out/host unreachable etc.

I presuming that WFW with added tcp/ip is compatible, I have put entries in teh "hosts" file, and the look up seems to work, plus I have made ARP entries as well..?

Another curiuos thing, if one tels (from the console) into a BBS session, the ethernet does not come up on the ports list..? any idears ?

Is there also a packet driver which will co-exsist with WFW/MS-add on for the DOS ndis driver, As I would still like to do some file bashing remotely, whilst the NOS is running, the machine hasn't got quite enough steam for proper windows.(386sx16) - anyone know anything about this ?

If anyone could offer any advice on the use of ethernet, I would mucho apprecio, or is there any good FAQ's etc, about? I know a little about IP etc, but am learning more everyday !

>I don't know where you get your information, Dave, but Windows 95 is
>very stable over time. I run it 24 hours a day.

but are you making it do anything? i have one program that's perfect until you do a file open and try to change the drives by using the dialog box - and on a 486sx you get hit with a message saying it's trying to use the math coprocessor (not there). This is definitely a software supplier problem (work around is to enter the drive/directory in directly) not a microsoft or ibm problem (i'm not sure what the drive change dialog is up to, but there's something strange going on...)

how about let's wait until microsoft actually puts an official version out for sale, eh? the guys evaluating it with respect to real work (testing equipment in burn in) say it's not bad, but they have their reservations. notably in writing device drivers for specialized hardware in use that was not a problem in DOS but is a problem in windows 95 or os/2 or etc. where the operating system isn't a program loader.

there's still supposed to be some 200 "major" applications that have problems with windows/95. i also expect the general public to have problems with installations. they may have had 400,000 people testing it, but it wasn't a random sample...it was people willing to go to great lengths to make it work.
